

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

TENTH BIENNIAL REPORT

WISCONSIN TAX COMMISSION

TO THE

GOVERNOR AND LEGISLATURE

---

NILS P. HAUGEN	}	<i>Commissioners</i>
THOS. E. LYONS		
CARROLL ATWOOD		

A. J. MYRLAND, *Secretary*

---

MADISON, WISCONSIN

1920

90

*To the Honorable the Governor and the Legislature of the State  
of Wisconsin:*

The Tax Commission respectfully submits herewith its tenth biennial report covering the activities of the department for the years 1919 and 1920, together with statistical tables of the results of administration, and such recommendations as experience and the revenue demands of the state and its municipal subdivisions show to be necessary.

Dated at Madison, Wisconsin, December 15, 1920.

NILS P. HAUGEN,  
THOS. E. LYONS,  
CARROLL ATWOOD.

*Commissioners.*

A. J. MYRLAND,  
*Secretary.*

Reel 100. 1. 5 - 28 - 29 P. 1. 1. 1.

[illegible]

## **CHAPTER I**

### **GENERAL REVIEW**

#### **ASSESSMENTS**

During the two year period covered by this report there has been an unprecedented increase in the value of the general property of the state. This is made apparent in the tables on subsequent pages.

As to real estate the rise in value has been quite regular and uninterrupted, and the commission has, as in previous years, based its valuation of counties on normal sales. Until the assessment of 1920 sales for a five years' period have been used. In 1920 this was limited to three years. It has been thought advisable to use an average of values of more than one year in order to avoid or minify the weight of questionable sales that will unavoidably creep into the statistics used. The larger the number of sales the more reliable is the result obtained. The activity in real estate has of late furnished far more sales than formerly. The 1919 state assessment of real estate showed an increase over the preceding year of 4.40 per cent. This is on the basis of using five years of sales. The increase in 1920 on the same basis would have been 6.33 per cent.

On a rising market using a five year period and making due allowance for the time necessary to collect statistics the valuation is placed about three years behind present values.

The valuation placed on the general property of the state in the state assessment becomes the basis of the tax rate applicable to railroads and some other public service corporations. Until recent years these corporations also showed an upward trend, and the five years' average of values applied to them worked with reasonable fairness. This gradual increase in railroad valuations not only ceased with 1916, but a decided decline in their values followed.

The corporations could justly claim that they were discriminated against if this difference in the trend of values in opposite directions were not recognized. The commission has in its late assessments given some weight to this contention in fixing the valuation of their properties. In the last state assessment therefore the commission departed from the five year average as to real es-

tate and used an average of three years. This made an increase of 12.20 per cent over the previous year instead of 6.33 per cent according to the usual five year method.

In valuing personal property the commission endeavors to arrive at present day values.

The state assessment of real estate was in 1919 \$3,178,663,175 and in 1920 \$3,565,811,448.

To show the trend in railroad values the stocks and bonds of the larger companies show the following totals on a five year average:

TOTAL STOCKS AND BONDS MARKET VALUE

	1914	1919
Chicago & Northwestern.....	\$431,412,231	\$386,588,517
Chicago, Milwaukee & St. Paul.....	649,122,158	512,386,046
Minneapolis, St. Paul & Sault Ste. Marie (including Wisconsin Central).....	184,274,955	169,122,257
Chicago, St. Paul, Minneapolis & Omaha.....	87,480,859	71,670,798
Chicago, Burlington & Quincy.....	380,320,550	355,740,967
Total five leading railroads.....	\$1,712,560,753	\$1,495,508,585

This shows a decrease in five years of 12.67 per cent, thus moving in opposite direction from real estate. Judging from quotations to date the present year will show still further decline although the tide now seems to have turned the other way. The decline in net earnings of railroads fully confirms the decline in value of the stocks and bonds. Deficits are not uncommon where net earnings were formerly constant and reliable.

The law contemplates that the tax on railroads shall be on an equality with that borne by the general property on the local rolls.

Using the true value of property in the state assessment in 1919 the commission found the value to be \$4,068,268,534 of which 78.33 per cent was real estate. The local assessors' valuation of all property in 1919 was \$3,543,014,846 or 87.09 per cent of true value. Real estate in the 1920 state assessment was 78 per cent of all property. The value of real estate in 1920 was increased 12.20 per cent and that of personal property 11.12 per cent over the year 1919 as found by the state assessment.

The generally rapid advance in values of all classes of property measured by present monetary standards cannot be expected to continue when the country returns to normal peace conditions. Some slackening in the value of land is already apparent.

Local assessors throughout the state have shown far better compliance with law than in earlier years. In 1910 the ratio of assessed to true value of all property was 61.28 per cent. In 1919 the ratio was 87.09 per cent. So that the local assessor not only

kept relative pace with advancing values, but gained on them. It is believed that this effort to assess at true value according to legal requirements has resulted in more equitable assessments of property within the same jurisdiction.

#### TAX RATES

The large and rapid increase in values may lead to the apparently logical conclusion that a lower tax rate would follow. This, however, is far from being the case. Public expenditures have increased far more relatively than have values. This is readily accounted for in the new public activities, such as highway construction and maintenance on an unprecedented scale, the increase in school expenditures, and the high cost of labor and material to carry on these activities. The average tax rate has advanced from \$13.18 per one thousand of true value in 1915 to \$18.95 in 1920. These are the rates applied to railroads and some other public utilities. In 1917 the railroads paid taxes amounting to \$5,328,476.69 at a rate of \$18.84+ per \$1,000, on a valuation of \$384,370,000. In 1920 the assessment was placed at \$360,734,000, but the increased tax rate of \$18.95+ per \$1,000 resulted in a tax of \$6,837,056.47. In other words, while the value decreased \$24,136,000 the tax increased \$1,508,579.78.

#### PUBLIC INDEBTEDNESS

In this connection it may not be amiss to call attention to a tendency to create public debt and to issue bonds to meet liabilities that in many instances sound public policy demands shall be met by current taxation. Attention is called to the report on Municipal Statistics published by this commission. The total amount of interest paid by all the cities of the state in 1916 was \$1,232,311. In three years this had increased so that in 1919 the cities paid \$1,681,406 interest, an increase of interest paid of 28.33 per cent in three years. As an illustration of this reckless tendency, in the city of Madison in 1920, fourteen cents of each dollar of taxes paid was required to meet interest. The city of Milwaukee in 1916 paid interest on indebtedness, amounting to \$551,811. In 1919 this had increased to \$811,597, an increase in three years of 46.71+ per cent. In 1910 the interest paid was \$448,000. There has been a steady increase each year since that time.

It is believed that this tendency is more pronounced in cities than in counties and rural communities, but it is not absent in the latter.

Wisconsin may well take warning from Ohio in this respect. The auditor of that state in his 1917 report calls attention to the amazing fact that while the eighty cities of that state, containing a population of over 5,000 each, collected in taxes \$26,411,178

for city purposes alone, it required \$180,657 in excess of that vast revenue to meet the interest payments and to retire bonds falling due, and that there was not one cent left for regular running expenses. He says:

As a whole Ohio cities paid the salaries of every public official, constructed all improvements, and met every dollar of regular running expenses, not from taxation, but by means of new bond issues. The per cent of annual income required to retire bonds falling due and pay interest \* \* \* was an average of over 100 per cent for all Ohio cities.

\* \* \* "New debts created during the year were \$2,985,978 in excess of all revenue received from taxation and \$14,674,082 more than the total of all indebtedness retired". He repeats this warning in his report of 1919.

The auditor of Cuyahoga County in which county Cleveland is situated, in a letter dated October, 1920, says about Ohio cities:

It is safe to say that the tax rates in our larger cities will run from \$2.00 to \$2.40 for the 1920 taxable year. \* \* \* Our cities are running into debt, piling up deficits which are then funded into bonds which in turn aggravate the financial crisis of the cities. The deficit of the city of Cleveland last year was \$5,750,000 which was funded into bonds. The year before it was \$4,500,000, and the year before \$2,500,000. In other words, irrespective of tax rates and tax receipts the municipalities seem to be spending money, running up debts, and then securing legislative sanction for funding these deficits.

The last quotation has reference to the limitation upon the tax rate in the Ohio statute.

#### REASSESSMENTS

Nine reassessments have been ordered and completed during the biennium since the last report. Fifteen applications are now pending. The law was amended in 1919 by reducing the property represented in a petition from ten to five per cent of the total assessment of the district. It makes it fairly easy for a large property holder to secure a reassessment, while the man with little of the world's possessions must secure others to join with him or submit to unfair discrimination. The commission is reluctant to order reassessments unless the inequalities are material. But it believes the requirement of the present law frequently works a hardship and is in conflict with the general spirit of American legislation that each individual shall be "entitled to a certain remedy in the laws for all injuries, or wrongs, which he may receive in his person, property or character; he ought to obtain justice *freely*, and without being obliged to purchase it, completely and without denial, promptly and without delay, conformably to the laws."

## COST OF TAX COMMISSION AND ASSESSORS OF INCOMES

## Year Ending June 30, 1919

Balance 1917-1918 appropriation July 1, 1918...	\$1,241.34
Transfer of accounting revenues 1918-1919.....	20,941.36
Annual appropriation 1918-1919 .....	175,000.00
Total .....	\$197,182.70
Less expenditures made during 1918-1919.....	200,691.75
Net Deficit .....	\$3,509.05

## Year Ending June 30, 1920

Balance 1918-1919 appropriation July 1, 1919—	
Deficit .....	\$3,509.05
Transfer of accounting revenues 1919-1920.....	23,948.07
Annual appropriation 1919-1920.....	170,000.00
Income tax appropriation 1919-1920—sec. 20.09 (4)	15,000.00
Emergency appropriation .....	37,000.00
Total .....	\$242,439.02
Less expenditures made during 1919-1920.....	241,291.91
Balance June 30, 1920.....	\$1,147.11

Detail of expenditures for the fiscal years ending June 30, 1919,  
and June 30, 1920.

	Year Ending June 30, 1919	Year Ending June 30, 1920
General office .....	\$30,711.04	\$31,161.20
Engineering .....	3,049.09	3,000.00
Inheritance tax .....	5,682.51	7,797.79
Income tax—office also 20.09 (4) .	10,385.92	15,860.08
Income tax—field .....	123,863.50	144,434.32
Statistics .....	9,276.97	10,792.53
Accounting department .....	13,579.58	24,963.12
Municipal reporting department..	4,143.14	3,282.87
Totals .....	\$200,691.75	\$241,291.91

The cost of the activities of the tax commission and the balances on hand at the close of the year as given above may vary slightly from the figures in other state reports for the reason that the tax commission has classified the costs by expenditures incurred instead of by cash disbursements. The apparent deficit in 1919 is due to this fact.

INCREASED COST OF ADMINISTRATION AND NECESSITY FOR INCREASED  
APPROPRIATION

The tax commission's annual appropriation for all purposes for the five fiscal years preceding July 1, 1919, was \$175,000 per year.

During this period there was a sharp advance in the industrial world in the salaries paid to clerks, stenographers, and accountants, and a more striking advance in the cost of stationery, paper, printing, office supplies, and equipment. During this five year period the tax commission kept within its appropriation by practicing the most rigid economy and by reducing engineering expense previously shared with the railroad commission from \$14,561.61 for 1916-1917 to \$3,049.09 for 1918-1919, a saving of over \$11,000 per year.

With a full realization that it would no longer be possible to efficiently administer its duties under the appropriation of \$175,000 a year previously allowed, the commission went before the board of public affairs and the 1919 legislature and asked for an appropriation of \$216,850 for the fiscal years 1919-1920 and \$222,850 for 1920-1921. The legislature appropriated \$170,000 for general purposes and \$15,000 additional for "salaries and necessary traveling expenses of accountants, their assistants, and others in checking up and verifying income tax returns," a total appropriation of \$185,000 for the two fiscal years above enumerated. Subsequent events proved the appropriation to be entirely inadequate and showed that the commission itself had underestimated the expense of maintaining the semblance of an efficient organization in the face of rapidly advancing costs. For the first time in its history the tax commission was unable to keep within the appropriation for the fiscal year ended June 30, 1920, and was granted \$37,000 additional by the emergency board. The deficit will be larger for the present fiscal year, and the requirements of the commission for the remainder of the fiscal year, 1920-1921, will be laid before the legislature in a separate communication.

A comparison of the commission's expenditures for the fiscal years, 1916-1917 and 1919-1920, is given below. While statistics show that the cost of everything entering into the administration of its duties was rising rapidly during 1917, the full effects of the high prices following the world war were not felt until 1920. Because of its past inability to raise salaries in anything like a proper proportion to the increased cost of living, the commission has been compelled, in order to maintain its organization on a reasonably efficient basis, to make salary increases during the present fiscal year, which will materially increase its expenditures for the fiscal year, 1920-1921, over 1919-1920.

#### COMPARISON OF EXPENDITURES

The expenses of the commission for the fiscal years, 1916-1917 and 1919-1920, are for comparative purposes listed by departments.

	1916-1917	1919-1920
General Office .....	\$31,053.55	\$31,161.20
Engineering .....	14,561.61	3,000.00
Inheritance Tax .....	5,033.74	7,797.79
Income Tax—Office .....	8,751.98	1,877.01
Income Tax—Sec. 20.09 (4) .....	0	13,983.07
Income Tax—Field .....	95,624.46	144,434.32
Statistical .....	8,468.53	10,792.53
Municipal Reporting .....	4,008.27	3,282.87
Accounting and Auditing .....	10,475.82	24,963.12
Total .....	\$177,979.96	\$241,291.91

This comparison shows that the cost of administration for the fiscal year ended June 30, 1920, was \$63,313.95 in excess of the cost for the fiscal year ended June 30, 1917.

#### ASSESSORS OF INCOMES DEPARTMENT

The department showing the greatest increase is the income tax field which includes all the expenses of the assessors of incomes; namely, salaries of assessors of incomes, their deputies and clerks, traveling expenses, stationery and office supplies, postage, telephone and telegraph, express, freight and drayage, paper, printing, and all other expenses in connection with their respective offices.

The increase in this department for the fiscal year, 1919-1920, over 1916-1917, was \$48,809.86. Of this amount \$34,754.91 was for increased salaries for assessors of incomes and their assistants. The reason for the increased expenditures in this department is twofold, the first being an enormous increase in the amount of work done in the offices of assessors of incomes; the second being the increased cost of all supplies used in these offices; large increases in both the number and salaries of clerical help and moderate increases in the salaries of assessors themselves.

In 1916, 62,272 individuals and firms filed returns in the offices of the 41 assessors of incomes. These returns showed taxable income of \$79,816,442, on which there was assessed income tax of \$1,601,213.35. In 1920, 206,626 individuals and firms filed returns showing taxable income of \$234,613,347.80, on which was assessed \$3,969,371.52 income tax. The soldiers' educational surtax figures could not be secured at the date of this writing. This great increase in the number of taxable returns represents more than a proportionate increase in the amount of income tax work thrown on the respective offices. To get the taxable returns referred to for the 1916 assessment, 294,000 blanks were furnished assessors of incomes; for the 1920 assessment, 518,000 blanks were used. After making due allowance for wastage and extra copies of blanks used by taxpayers for duplicates, the above figures show that at least half of the returns filed in the various offices showed no taxable income. All returns whether showing taxable

income or not, must be audited and often more time must be spent in the examination of a return showing no tax than on a taxable return which lists but few items of income and deductions. Thousands of laboring and trades people filed income tax returns for the first time during 1919 and 1920. Owing to the unfamiliarity with the blanks and income tax procedure in general, errors were numerous. This involved correspondence and personal interviews, thus further over-taxing the generally limited facilities of the assessors' offices. Because of the abnormal incomes in certain lines of industry in 1918 and 1919, large taxpayers have been inclined to employ the best legal talent obtainable in an effort to reduce taxable income by every possible technicality, and in some cases, by every subterfuge imaginable. Such cases delay the auditing, as the assessor of incomes may have to ask the tax commission for rulings, or for assistance in auditing the books of the taxpayer.

For the three years prior to 1919 real estate sales had not materially increased in number, but in 1919 the number of such sales was practically doubled. As real estate values had advanced rapidly, many of these sales showed taxable profit. Taxpayers are somewhat reticent in reporting profits on sales of real estate or other capital assets. In numerous instances the property was owned before the incidence of the income tax law and it became necessary to establish the fair market value of the property on January 1, 1911. This necessitated personal investigation by the assessor of incomes. He was compelled to tabulate sales of similar property sold around January 1, 1911, where such information was obtainable, and to consult disinterested parties with reference to the property in question. In case the taxpayer and assessor of incomes cannot get together, the whole matter must be threshed out before the income tax board of review.

Another highly important duty, involving much painstaking work and a high degree of good judgment, placed on the assessors of incomes, is the fielding of all sales of real estate made in the state during each year. The statutes require that this information be compiled. The same is used by the tax commission in making the state assessment, and is used by the assessors of incomes and the county boards in making the county equalizations. Before 1916, the fielding of sales cards was done by employees of the tax commission from the general office at an annual expense of approximately \$11,000, the expense being charged to the main office. But beginning with 1916, the fielding of all sales cards was made primarily the duty of the assessors of incomes. The number of "good" sales retained for equalization purposes for 1916 to 1919, inclusive, was as follows:

1916—24,606	1918—24,368
1917—24,467	1919—47,718

Experience has proven that approximately 50% of all sales are useless for equalization purposes, so approximately 49,000 sales were fielded each year for 1916, 1917, and 1918, and over 95,000 for 1919.

In selecting sales for equalization purposes, "sucker" sales, many trades, sales to near relatives, and sales made under abnormal conditions, must be eliminated. The assessor of incomes must exercise sound judgment in retaining or rejecting sales cards if the state and county equalization is to be fair. That the assessors of incomes are doing this work faithfully is evidenced by the fact that their reports are accepted without question by most county boards. These sales data are becoming more difficult to obtain each year. The seller often refuses to divulge the sale price, hoping by his silence to escape paying income tax on the profits of his sale. The purchaser may have a mistaken idea that his property will be assessed at cost while his neighbor's assessment may not be adjusted, and he, likewise, may refuse information. The real estate broker or agent withholds information when requested to do so by the vendor and vendee. The consideration mentioned in the deed is probably \$1.00, and the parties may not affix revenue stamps of proper value, which misguides investigators. In order to successfully field all sales, the detective instinct of the assessors of incomes must be highly developed. The work involved in compiling these necessary data is enormous and in Milwaukee county especially, forms no small part of the work of the office.

The soldiers bonus and soldiers' educational surtaxes also threw additional work on the offices of the assessors of incomes, as well as on the general office. The computation of the two taxes was required to be made and the assessment entered on the rolls after the referendum of September, 1919. Owing to the late date on which the verdict of the people became known, it was necessary to drop all other work and immediately proceed to compute these taxes in order that the tax rolls might be in the hands of the local treasurers on the prescribed dates. Many taxpayers who had paid little attention to the accuracy of their returns because they knew that their personal property offset would take care of the regular income tax, when confronted with a cash tax without offset, flocked to the office of the assessor of incomes to correct their returns or wrote frenzied letters of appeal. The result was extended correspondence and delay at a time when every office was already overburdened and it was necessary in some instances to employ additional help for the emergency. While this situation will not be repeated to the same extent, unless similar new legislation should be enacted in the future, the soldiers' educational bonus surtax quite materially adds to the work of the respective offices.

In order to adequately handle the increased burdens of their

offices, as enumerated in the preceding paragraphs, it became necessary for assessors of incomes to employ additional deputies, stenographers and clerks. On June 30, 1917, there were 42 permanent employees in the 41 offices in the state. On June 30, 1920, there were 83 such employees in the 40 offices in the state. This is an increase of practically 100%, the greater part of which is in the Milwaukee office.

Not only has the number of employees in the department doubled, but it has become necessary to pay larger salaries. Immediately after our entrance into the world war the Government became a strong competitor for stenographers, accountants, and all other clerical help at salaries far in advance of those previously paid by the tax commission. Not only did industrial concerns raise salaries of clerical help all along the line but it was common for clerks to enter factories and earn much larger salaries than they could ever hope to receive as clerks. County and city governments granted substantial increases to their employees, and other departments in the capitol more fortunate in the matter of appropriations than the tax commission, made flattering offers to the more competent of the tax commission employees. Resignations were of frequent occurrence, and as is generally the case, the most competent and badly needed employees were always the first to go. The tax commission faced a serious situation. It realized that it could not keep within its appropriation and pay salaries on a par with other state departments, the government, or industrial concerns. If a valued employee left its service, the vacancy could not be filled even by an inexperienced person at the salary paid to the retiring employee. If the salary of any particular employee were raised, it was necessary to raise the salaries of other employees in the same class. With this situation prevailing in its own general office and in the offices of the assessors of incomes with reference to deputies, stenographers and clerks, the commission was forced to revise salaries upward. And after having raised the salaries of its clerical help, the assessors of incomes themselves next came in for consideration.

It has long been realized that these officials have been notoriously underpaid. For the fiscal year, 1916-1917, the average annual salary of 39 assessors of incomes, outside of Milwaukee and Dane counties, was \$1207. Milwaukee and Dane counties are eliminated as the Milwaukee office is in a class by itself, and in Dane county the assessor of incomes at that time was receiving additional compensation for special work done for the tax commission. Even the most conservative will agree that any person possessing the qualifications required of an assessor of incomes could not or should not work for such a pittance with the rapid advance in the cost of living prevailing during the last three years. Six resigned during the last two fiscal years and accepted lucra-

tive positions elsewhere. Early in 1920 there were six more resignations offered, including some of the most important offices in the state. In each case the individual had an offer of another position at a salary more in keeping with the increased cost of living. Threatened with the situation of having an organization completely wrecked that had been years in building, the tax commission approached the emergency board and received assurance that the work of the commission must be efficiently maintained. A moderate raise in the salaries of assessors of incomes was granted for the year ended June 30, 1920, with the promise of a further increase for the year ended June 30, 1921, and with the full understanding that the matter of securing an adequate appropriation would be laid before the 1921 legislature. The number of assessment districts has been reduced from 41 to 40 in an effort to economize. On June 30, 1920, the average annual salary of 38 assessors of incomes outside of Milwaukee and Dane counties was \$1524. For the present fiscal year ending June 30, 1921, the average annual salary is \$1746, also excluding Milwaukee county. That the increases granted to employees in the general office and in the field were merited will not be questioned by any one conversant with the facts. That the increases in the salaries were much less than the increase in the cost of living is proved by the following table prepared by the United States Department of Labor, Bureau of Labor Statistics, and released for publication September 16, 1920.

This table shows the increase in the cost of living in the United States from 1913 to June, 1920. These figures are averages based on the prices secured in 31 cities, the results of which will appear in the September number of the Monthly Labor Review.

It will be noted that the total increase from an average for the year 1913 to June, 1920, is 116.5 per cent, the largest increase being in furniture and furnishings, 192.7 per cent; the next highest, clothing, 187.5 per cent. The total increase for the six-month period from December, 1919, to June, 1920, is 8.6 per cent.

## CHANGES IN COST OF LIVING IN THE UNITED STATES

Item of Expenditure	Per cent of Total Expend- iture	Per cent of increase from 1913 (average) to							
		Dec. 1914	Dec. 1915	Dec. 1916	Dec. 1917	Dec. 1918	June 1919	Dec. 19	June 1920
Food.....	38.2	5.0	5.0	26.0	57.0	87.0	84.0	97.0	119.0
Clothing.....	16.6	1.0	4.7	20.0	49.1	105.3	114.5	168.7	187.5
Housing.....	13.4	*	1.5	2.3	.1	9.2	14.2	25.3	34.9
Fuel and Light.....	5.3	1.0	1.0	8.4	24.1	47.9	45.6	56.8	71.9
Furniture and Furnishings..	5.1	4.0	10.6	27.8	50.6	113.6	125.1	163.5	192.7
Miscellaneous.....	21.3	3.0	7.4	13.3	40.5	65.8	73.2	90.2	101.4
Total.....	100.0	3.0	3.6	18.3	42.4	74.4	77.3	99.3	116.5

\* No change.

While the cost of living rose 116.5% in the 7.5 years, enumerated in the above table, it will be noted that prior to 1916 the increase was only 3.6%. The salaries of assessors of incomes during the fiscal years, 1916 and 1917, to June 30, 1920, were creased on the average only 26.36%, and to June 30, 1921, were increased 44.66%. Stenographers have been raised from 33 1/3% to 56%, and clerks have been raised from 35% to 60%, depending on experience and ability.

In the Assessors of Incomes' department, the item showing the greatest increase next to salaries is postage, which cost \$4482.58 in 1916-1917 and \$9033.69 in 1919-1920, an increase of \$4551.11. As the number of income tax returns sent out has nearly doubled and as correspondence increases in proportion to the number of returns, this expenditure is easily explained.

The next item of increase is traveling expense, which in this department amounted to \$11,955.99 in 1916 and 1917, and \$15,550.71 in 1919 and 1920. This increase needs no comment. Railroad fare has increased from two cents to three cents per mile. Meals, lodging, and livery have increased materially in cost. Most assessors of incomes must own automobiles to administer their offices efficiently. Both the cost of cars and their maintenance and operation have increased materially, and a more liberal allowance should be made for this increased expenditure.

While the expenses of the assessors of incomes department for 1919-1920 increased 51.05% over 1916-1917, the number of taxable returns filed by individuals and firms in 1920 increased 231.75%; taxable income increased 193.84%; and the tax assessed increased 147.91%.

#### GENERAL OFFICE AND ENGINEERING DEPARTMENTS

Comparison of other departments shows that the expenses of the general office have not materially increased. Engineering expense decreased from \$14,561.61 in 1916 and 1917 to \$3,000 in 1919 and 1920, the decrease being \$11,561.61.

#### INHERITANCE TAX DEPARTMENT

Inheritance tax expense increased from \$5,033.74 in 1916-1917 to \$7,797.79 in 1919-1920, the increase being \$2,764.05.

#### STATISTICAL DEPARTMENT

The statistical department expenses were \$8,468.53 in 1916-1917, and \$10,792.53 in 1919-1920, an increase of \$2,334.

## MUNICIPAL REPORTING

The expense for municipal reporting has remained practically stationary.

The increased expenditures in the different departments are caused by increased salaries and the increased cost of supplies, both of which have been fully discussed in connection with the income tax field department.

## ACCOUNTING AND AUDITING DEPARTMENT

The expenses of the accounting and auditing department were \$10,475.82 in 1916-1917, and \$24,963.12 in 1919-1920, an increase of \$14,487.30. This additional expense is explained by an increase in both the number of accountants employed and the salaries paid them. There has been an unprecedented call for accountants by the government, the state, and by industries. In order to retain competent men, the tax commission has been forced to meet outside competition. However, the cost of this department is immaterial as it is self-supporting. Accounting work is furnished at cost to the municipalities requesting it. While the expense of this department is included in the tax commission's expenditures, the receipts are also added to the annual appropriation in determining its receipts.

## CORPORATION INCOME TAX DEPARTMENT

All corporation income tax returns are audited in the office of the tax commission, the number of returns being approximately 12,000. The incomes reported for 1917, 1918, and 1919 were swelled enormously over any prior period. The various federal income and excess profits tax laws imposed federal taxes also without precedent. Different accounting procedure to comply with federal laws were adopted by thousands of corporations. The tax commission fully realized that if large amounts of income were not to escape taxation, it would be necessary to make a more comprehensive audit of the returns than had formerly been made and that it would also be necessary to have field auditors to check up the books of the corporations where the correct amount of income was in doubt. In order to do this work properly, it was necessary to employ auditors of high ability who were not only expert accountants, but who were well versed in both the state and the federal income tax laws. To get or retain men of this caliber it is necessary to pay salaries in line with those paid by the United States government, private industry, and other state departments. The 1919 legislature made a special appropriation of \$15,000 to defray the expenses of accountants, their assistants, and others in checking up and verifying income tax returns. As the general ap-

appropriation of the commission was cut \$5,000 and as the expenses of the commission for the last fiscal year over-run the appropriation, it was not possible to apply the entire appropriation on the salaries and expenses of the accountants, as had been intended.

The commission had one competent office auditor and in April, 1919, secured the services of a competent field auditor. It was necessary to give the new man at least one month's training in the office before sending him on the road, and it was further necessary to take him off the road to assist in computing and assessing the bonus surtaxes so that he was able to be on the road checking corporation returns about six months of 1919. He will spend about ten months in actual field work in 1920, but the commission is able to show the results of only the first 7½ months of the year at the time of writing this report. A tabulation of work completed and entered on the 1919 and 1920 tax rolls is given below.

	Number of Corporation Returns Examined	Net Increase in Taxable Income	Net Increase in Income Tax
1919	68	\$860,571.00	\$47,336.00
1920	59	897,006.00	55,498.00
	<hr/> 127	<hr/> \$1,757,577.00	<hr/> \$102,834.00

The cost of this field work was \$2,797 for 1919 and \$3,288 for 1920.

The additional Soldiers Cash Bonus and the Soldiers' Educational Surtaxes, being temporary in nature, are not shown in the above computations. Practically all 1918 returns showing an increase in taxable income show an increase in both bonus taxes, and 1919 returns showing an increase in taxable income show additional Soldiers' Educational Surtax. The amount of additional bonus taxes assessed is approximately \$50,000 and represents an absolute gain to the state. There is a large number of corporations that should be investigated during 1921, or large amounts of additional income for 1917 will be lost because of the three year limitation imposed by law.

It will be seen that this work is highly profitable to the state and the commission recommends that the next appropriation be sufficiently large to allow the employment of at least two field auditors. Field work of this character has been conducted by the United States Government since 1913 and has resulted in the collection of large amounts of additional federal income and excess profits tax.

Many corporations are asking the commission for an auditor to assist in clearing up matters in controversy with the commission or to assist them in opening new books, setting up proper values for assets acquired before the incidence of the income tax law. All of this work is highly valuable to the state, not only in increased

taxes collected, but in that the taxpayer feels that he is being given a square deal. If, because of improper accounting methods, he is paying more tax than he lawfully should pay, his errors are pointed out and he is assisted in rectifying past errors as far as possible. The moral effect of these personal investigations is good. Willful tax dodgers who have made income returns and have boasted that "the state never checks us up as the government does," are finding that the state income tax law is alive and carries penalties. Because it has become a matter of general knowledge that the state contemplates checking the books of corporations, the commission is receiving large numbers of amended returns showing additional income voluntarily filed by the taxpayer after having his books audited by some responsible accounting firm.

The income tax returns of corporations reporting incomes for 1917, 1918 and 1919 have been carefully audited and analyzed by the office auditor and his assistants. The incomes reported and the taxes assessed for these three years were the largest in the history of the income tax law. For a comparison, see tables in this report. The 1918 incomes of 765 corporations were increased by office audit \$10,122.789 over the amount voluntarily reported by these corporations. The additional income tax assessed was \$595,546.43, additional soldiers' bonus surtax \$446,584.14, and additional educational bonus surtax \$89,274.60, total, \$1,131,405.17. The incomes of the corporations under consideration were increased all the way from \$5.00 to \$1,705,861. In three instances the net income was increased over \$1,000,000. In only one case out of the 765 enumerated was the action of the commission challenged in the courts. The supreme court of the state upheld the tax commission.

Because of these conditions, the income tax office department necessarily shows larger expenditures. The cost of this department in 1916-1917 was \$8,751.98, and in 1919-1920 was \$15,860.08.

The income tax law apportions 10% of the income tax collected to the state. It was expected that the maximum cost of administration to the state would not exceed this amount. It is interesting to note that the income tax has become a material factor in the revenues of the state, the amounts paid to the state in cash each year far exceeding the total cost of administration. The state's share of income taxes paid in cash during the last four fiscal years ending on June 30 is as follows:

1917	.....	\$295,972.67
1918	.....	616,106.78
1919	.....	699,965.99
1920	.....	631,022.92

## CONCLUSION AND RECOMMENDATIONS

The foregoing has been prepared in order that the legislature and others interested might have a full statement of the existing conditions which make necessary an increased appropriation if the work of the tax commission is to be carried on in an efficient manner. We fully believe that the people of the state of Wisconsin do not desire to have the services of the commission crippled by insufficient appropriations. It can be seen easily that a few thousand dollars in salaries paid to faithful and competent employees cut very small figure when compared with the magnitude of the transactions involved. For example, in one instance where no taxable income was reported, through the co-operation of the tax commission, the assessor of incomes, and the attorney general, a tax of \$90,000 was collected. In another case, a tax of \$42,000 was assessed after a full investigation by the tax commission and the assessor of incomes where only \$8,500 had been reported. In the tax commission office, had the auditor fallen down on as small a number as three large corporation returns in making the 1919 assessment, the loss to the state in taxes would have been more than the entire appropriation made to the tax commission for the same fiscal year. The employees of the tax commission must all be of a high order as the work is very technical in nature, and carelessness or incompetency could result in very costly blunders to the state. With this statement of the facts before the legislature, we trust that an emergency appropriation of \$74,275 for the balance of the fiscal year ended June 30, 1921, will be made. An appropriation of \$292,475 for 1921-1922 and \$309,275 for 1922-1923 will in the opinion of the tax commission be necessary to secure that efficiency of service to which the people of the state are entitled.

## CHAPTER II

### COUNTY ASSESSORS; REASSESSMENTS

Article VIII of the state constitution provides that "the rule of taxation shall be uniform, and taxes shall be levied upon such property as the legislature shall prescribe." The supreme court has repeatedly held that this provision applies to all taxable property in the state, and contemplates equality of the tax burden between property of the same value. The constitution does not preclude diversity in the method or form of taxation so long as the burden imposed is proportionate to value, but does condemn every method and system of taxation which results in imposing unequal burdens on property of the same value. This constitutional provision is supplemented by not less than half a dozen statutes emphasizing the importance of equality in the assessment and collection of taxes, and prescribing severe penalties for failure to comply with their terms. Neither constitution nor statutes are necessary to establish the principle for it is inherent in the nature of all ad valorem taxes and required by every consideration of justice and common sense.

Notwithstanding these plain and positive provisions of law, assessing officers continued to use different standards and bases of assessment for upwards of fifty years. Realizing the impossibility of securing equality by mere declaration of law, the legislature in creating the tax commission specifically provided that it should "have and exercise general supervision over the administration of the assessment and tax laws of the state, over assessors, boards of review, assessors of incomes, and over county boards in the performance of their duties as county boards of assessment, to the end that all assessments of property be made relatively just and equal, at true value, in substantial compliance with law." We have, therefore, not only the constitutional mandate and several statutory enactments but the specific direction of the legislature as well to see that equality in the assessment and distribution of taxes be secured.

But while the legislature imposed this duty on the tax commission, it utterly failed to provide it with the necessary machinery to attain that end. There are about 1700 assessment districts in the state of Wisconsin, many of which have one or more assistants

engaged in the work so that the total number of persons employed in the assessment of property in the state each year is not less than 2000. Except in a few chartered cities, all these assessors are chosen by popular vote at the general spring election in April and required to begin their work on the first day of May following. There is no test of ability, standing, or experience required by any of the statutes providing for the selection of these assessors, and the salary prescribed is such as to deter competent men from receiving or accepting the post. While the tax commission is charged with the duty of securing uniformity in assessments and equality in the distribution of the tax burden, it can neither select the assessing officers, nor prescribe their qualifications, nor fix their compensation, nor dismiss them for incompetency. The result is that 2000 different assessing officers are chosen at random every spring with no requirement of qualification, responsibility, or experience, and no compensation sufficient to attract competent men to the service, and directed to assess over \$4,500,000,000 worth of property in the succeeding two months in a uniform and equitable manner. Is it possible to conceive of a more absurd or illogical method of securing the desired result? Imagine for a moment the effect on a private business required to be conducted in the same manner; namely, by employing a general manager to conduct it, and then depriving him of power to hire his own help, fix their compensation, or dismiss them for neglect or incompetency. Yet this is precisely the status of the tax commission towards assessments under existing law. Uniformity of assessment under these conditions would be little short of a miracle, and the age of miracles is gone.

The absurdity of this situation was pointed out in our 1916 and 1918 reports, and a recommendation made that a system of county assessors with competent help, all chosen under civil service rules, be substituted for the system of local assessors now in vogue. The conditions which led to that recommendation are the same now as then, and the reason for the change becomes more urgent as the weight of the tax burden increases. We, therefore, renew and repeat the argument and recommendation, believing it to be the most urgent and important step in tax reform.

The county assessor system is neither new nor untried, but on the contrary, has been in operation for years in many southern and western states, (23 in number according to the latest available information), and has the endorsement of all administrators, economists and students of taxation. In answer to an inquiry, the tax commission of Arizona under date of January 31, 1919, wrote as follows:

There are 14 counties in Arizona, and each county has one assessor who appoints all his assistants, and together they assess all of the property in the county that is not assessed by the state tax

commission. \* \* \* I think that every Rocky Mountain state has county assessors, and that there is not a citizen in the whole area who can comprehend the township assessor.—To him, the idea is silly.

The assessors of the city of Milwaukee have been chosen by the tax commissioner of the city under civil service rules for many years past, and there has never been any demand for return to the elective system. There is a parallel in the position of assessors of incomes except that these officers are neither authorized by law nor equipped with the necessary machinery to make original assessments. Their only authority is to supervise and direct the work of assessors, and report their delinquencies to boards of review. Even this partial authority has resulted in a material improvement in assessment conditions, but the progress made has been at the price of enormous waste of time and energy, and still falls short of what the result might be if the persons chosen to make the assessment in the first instance were selected in the same way.

It is a trite observation that assessment is the most important step in tax administration. As stated by a committee of the National Tax Association appointed to report on the method of selecting assessors:

The local assessor is the very foundation upon which the administration of the whole general property tax rests. Unless he is a man of good judgment, familiar with values, endowed with sufficient moral courage to be fair, and diligent enough to find and place all the property in his district upon the assessment roll, his work invariably falls short of the legal standard, and usually results in the grossest injustice.

If the local assessor omits property from the roll or fails to use the same standard of value for all persons and classes of property, no subsequent county or state equalization can cure the defect. The latter deals with municipalities as units, but does not restore omitted property or correct inequalities in the local roll. Any increase in the valuation of a district for the purposes of equalization necessarily falls upon the property already on the roll, and according to the valuation given it, however unequal that may be. Property which has been omitted still escapes, and that which appears on the roll, already over-assessed, must bear the increased burden. Equitable distribution of the property tax can only be secured by proper local assessment.

The legislature early recognized this principle by requiring all property to be assessed according to the same standard, but that it was not sanguine of securing this result is indicated by the further provision for the equalization of assessments within each district and between different districts through state and county

equalization. Of course, if the original assessments were made on a uniform basis as the law prescribes, no further equalization would be necessary. The utter failure to secure either legal or equitable assessments by the prevailing method has been recognized by courts, commissions, and administrators everywhere and is a matter of common knowledge. The subject was fully discussed in former reports and need not be repeated here. It sufficiently appears from the fact that after sixty years of experience the average rate of the assessment of all property in the state of Wisconsin for the year 1911 was less than 65 per cent of its true value, while specific descriptions of property were assessed all the way from 10 to 200 per cent of their value.

The act creating the commission empowered it to cause complaints to be made for violation of the assessment laws and to apply for the removal of assessors but only dissatisfied taxpayers could make the complaint and only the district attorney could prosecute. The law's delay is proverbial, the assessment season short, and the average district attorney not overzealous in antagonizing the sentiment of the community whose commission he bears. It is needless to state that this remedy proved of little value. The statute authorizing the reassessment of any town, city, or village when the original assessment was not made in substantial compliance with law, and public interest required such reassessment, was enacted the same year and proved a very material aid so long as the commission was permitted to act on its own motion. In 1911 the office of assessors of incomes was created and the duties formerly imposed on supervisors of assessment were transferred to them. These officers are appointed by the tax commission under civil service rules and have proved a very intelligent and useful force, but their powers are only advisory and the reassessment statute remains as the only remedy for compelling obedience to the law.

By the aid of these two agencies substantial improvement has been made, as shown by the fact that between 1912 and 1919 the average ratio of assessed to true value for all property in the state increased from less than 65 per cent to 87 per cent, and that the most flagrant inequalities have been removed. But this result has been secured at the cost of much needless friction and at an enormous waste of time and energy. The practice of undervaluation is one of long standing, based upon widespread misunderstanding as to its effect. The prejudice against a full value assessment in some districts amounts to a fetish and the effort to secure it provokes violent opposition. Of course, this prejudice has no justification in reason or law but it exists just the same. Through a campaign of education it has been largely overcome in the southern part of the state where values are reasonably certain

and stable and greater respect for law prevails, but it still persists in many northern districts.

Efforts to prevent such discrimination and compel some recognition of the assessment laws provoke bitter opposition, but that is not an unnatural outgrowth of our antiquated and illogical system of assessment machinery, which imposes upon the tax commission the duty of securing proper and equal assessments and then industriously denies them every means of securing that result.

At its 1914 meeting the National Tax Association appointed a committee to investigate and report upon the method of selecting assessors. The committee was made up of representatives of six different states, chosen for their acknowledged ability as administrators and tax experts. The report of the committee submitted at the 1915 conference summarized the situation in the following language:

The office of assessor, as at present constituted in nearly all states of the union, because of the meager pay and small importance attached to it by people generally, is seldom sought after and rarely filled by capable men. More often than not, men competent to make a good assessment if tendered the position, refuse to accept. Not infrequently the place is given to some one simply because he needs it or because he will do the work for less than anybody else or because he will be an easy mark for influential tax dodgers. Men of this type soon discover that the surest way to remain long in office is to be easy and accommodating AND ABOVE ALL TO KEEP THE ASSESSMENT OF THEIR DISTRICT DOWN TO THE LOWEST POSSIBLE POINT. The inevitable outcome is of course a low assessment and the usual outcome is an assessment that is most glaringly unjust.

Similar expressions might be quoted from tax authorities everywhere. It would be unjust, however, to classify Wisconsin assessors generally as mere "good fellows" or "ne'er-do-wells" or "easy" in the sense of yielding to what they believe to be unjust. Undoubtedly, officers of this stamp are to be found but the majority of our assessors are fairly intelligent and well meaning men, ranking well up with the average of their communities. In many cases they are both able and willing to make a proper assessment and would do so if relieved from the pressure for under-valuation. Their failure to do so is traceable in most cases to the sentiment of their communities and their unwillingness to incur the displeasure of their neighbors and friends rather than by desire to retain office or show favoritism. This attitude is natural enough under present conditions, and the remedy is not by abuse of the assessor but by change in the system. Unless perpetual friction is desired, a change in our assessment machinery should be made.

**Proposed Remedy**

The complete remedy for this situation undoubtedly would be a force of assessors appointed by the tax commission or other state agency under civil service rules, working under the direction of and subject to removal by the appointing power. All administrators and students of taxation agree in this view.

In discussing the subject before the National Tax Association in 1913, Honorable D. M. Link, Tax Commissioner of Indiana, said: The ideal system would comprehend machinery as independent of local influence as the Internal Revenue Department of the Federal Government. But this is an ideal which can only be attained through the process of evolution and not by revolution.

This is also the conclusion of the committee appointed to report on the Methods of Selecting Assessors, above referred to.

But this system is not available in Wisconsin for two obvious reasons: First, it conflicts with the much vaunted and more abused principle of home rule, to which our people have become accustomed, and are strongly attached. Second, because this method of selecting local officers is prohibited by Section 9 of Article XIII of the state constitution. So far as material that section reads:

All county officers whose election or appointment is not provided for by this constitution shall be elected by the electors of the respective counties or appointed by the boards of supervisors or other county authorities as the legislature shall direct.

The following clause prescribes the same rule for town, city, and village officers, so that whether the assessor so chosen be regarded as a local or county officer, his appointment by state authority is prohibited. Further consideration of this plan is, therefore, futile. Having in mind the impossibility or impracticability of the foregoing program in many states, this committee recommended an alternative plan in the following language:

This plan, like that already outlined, makes the county the unit of government for assessment purposes, but unlike the other, the assessor instead of being appointed is elected by popular vote for a term of at least four years and is removable from office only for cause and in the same manner that other county officers are removed. This plan provides that no one shall be eligible to hold the office of assessor who has not passed a satisfactory civil service examination to determine his fitness for the place and received a certificate from the examining board showing that he is qualified to hold the position. \* \* \* It further provides that the assessor shall devote all his time to the work of his office and that when he is unable without assistance to properly assess all property in his county, he may under certain regulations and restrictions, appoint a sufficient number of deputies and assistants to insure a complete and accurate assessment. Such appointees in all cases to be selected from a civil service list and to be removed by the assessor at will.

The model system of state and local taxation prepared and recommended by the National Tax Association within the last three years after emphasizing the importance of assessments in the process of taxation, declares:

Assessment districts should be large enough to justify the employment of at least one permanent official in each such district, who should receive a salary sufficient to make it possible for him to give all his time to the work. Such permanent assessors should be provided with well-equipped offices, a suitable number of permanent clerks, and such part-time assistance as may be needed for a short period in each year. Even if assessments are not made annually, there is always enough work of investigation and of keeping track of new developments to justify the employment of a permanent force. At present many assessment districts are too small to make proper compensation possible; and the result is that the work is done by persons who cannot give to it the time it ought to receive and seldom acquire the necessary expert and technical knowledge. MANIFESTLY, THE COUNTY IS A BETTER ASSESSMENT DISTRICT THAN THE TOWNSHIP; AND GENERALLY SPEAKING, WE MAY SUGGEST THAT IT IS UNDESIRABLE TO ERECT ASSESSMENT DISTRICTS SMALLER THAN A COUNTY UNLESS SUCH DISTRICTS HAVE A SUFFICIENT POPULATION TO ENABLE THEM TO EMPLOY AT LEAST ONE PERMANENT ASSESSOR AND A SUITABLE STAFF.

This plan could be adapted to our situation by making the county the unit for assessment purposes instead of the local district, by prescribing definite qualifications under civil service rules as a condition of eligibility to the office of assessor, and by placing the work under the supervision of and making the incumbent subject to removal by the tax commission. Instead of election by popular vote it may be preferable to have the assessor appointed by the county board, or such county authorities as the legislature may designate. The method of selection is relatively unimportant compared with the qualifications to be required, the permanency of tenure to be secured, and the freedom from local influence that would result.

#### **No Constitutional Objection**

The consensus of expert opinion and our own experience point to the necessity and desirability of such a change and it is believed that it can be made without conflict with the constitution. The only effect would be to enlarge the assessment districts from the town, city, or village to the county unit and make the assessor a county instead of a local officer. The people of the county served, or their authorized representatives, would still make the selection without encroaching on the principle of home rule. In this way no violation of the constitution would result.

The advantages to be derived from such a course would be:

- (1) A competent assessment force, permanently and continuously engaged in the work.

(2) Uniformity of assessment as to all persons and classes of property in the county, thus doing away with local influence and the friction incident to equalization by the county board.

(3) The elimination of the incompetent and indifferent assessor with all the evils that follow in his train.

(4) A great reduction in the assessment force and consequent reduction of expense.

(5) The adoption of more uniform and systematic methods of assessment and a more equitable distribution of the tax burden.

(6) Preservation of all the advantages without the disadvantages of the principle of home rule.

We strongly recommend the adoption of this program as the greatest and most urgent measure of tax reform.

## REASSESSMENTS

An indicated elsewhere in this chapter, the authority conferred on the tax commission to make reassessments by sections 1087—45 and 1087—52 in cases where the original assessment is radically defective, is the only means provided for compelling obedience to the assessment laws. The provisions for removal of assessors and imposing penal fines are practically useless for the reason that complaint can seldom be made until the assessment is well advanced and the delays incident to court procedure make it practically impossible to bring these proceedings to a head until after the assessment season is closed. Moreover, both of these remedies merely penalize the assessor and neither of them operates to correct the defects in the assessment itself.

In this situation, it is all important that the tax commission be authorized to exercise the power of reassessment whenever conditions arise to require that course. The commission is in constant touch with assessment conditions through reports of assessors of incomes and correspondence from taxpayers who naturally look to it to correct inequalities and prevent discrimination. Many of these complaints are received during taxpaying time when property owners first learn of the inequitable assessment of their property. Some of them show such unmistakable violation of law and clear discrimination against the parties complaining as to call for summary relief, and property owners have difficulty in understanding what the tax commission is for if not to correct such abuses. In the case of non-residents or small taxpayers, it is practically impossible to secure the number of signers to a petition now required as a condition for ordering a reassessment. Indeed, as the statute now stands, the remedy is not available to

the average small taxpayer at all and is seldom invoked except by large land companies and timber owners.

As originally enacted, the statute permitted reassessments to be made on the complaint of a single taxpayer. Later the commission was authorized to act on its own motion. The amendment of the statute at the closing hours of the session of 1917 so as to require a petition of the owners of ten per cent of the taxable property of the district in order to institute the proceedings, materially weakened and impaired the authority of the commission and assessors of incomes throughout the state. The legislature of 1919 reduced the percentage of taxable property required to apply for a reassessment to five per cent of the assessed valuation of the entire district, but this has not materially improved the situation. At the same session a bill was introduced to authorize the correction of the assessment of specific classes or descriptions of property in cases of gross inequality or flagrant discrimination, but the bill as presented was so encumbered by limitations and amendments as to be practically useless.

It is difficult to understand why a department charged with the duty of enforcing the assessment and tax laws and securing the equality guaranteed by the constitution should have its hands tied and feet hobbled in the performance of that duty. No such restriction is placed upon any other department of the state government charged with the same or similar duties. For example, the agricultural department can order the destruction of valuable live stock infected with contagious disease. The dairy and food commissioner can seize and confiscate impure food in the interest of public health; and the health department can quarantine residences, shops and places of business and otherwise interfere with the business and daily activities of the community. Even the district attorney can make complaint on his own motion charging any citizen with a crime, thus bringing humiliation to him and his family. All of these officers are authorized to take these steps on their own motion and are not required to secure a petition or take a referendum as to whether they will enforce the law or not. Surely, a reassessment for the purpose of equalizing assessments and equitably distributing the tax burden is a less drastic interference with private rights than those above recited. Nevertheless, for years past this department has been deprived of the only weapon in its possession for the performance of its full duty under the law for the sole reason that it may restrict the prerogatives of a local boss or displease a disgruntled partisan.

It is not believed that the people of the state favor or desire these unreasonable restrictions on the administration of assessment and tax laws and it is hoped that the time has at last arrived when the subject can be considered with moderation and common

sense. If so, there is little doubt that the legislature will remove embarrassing limitations and restore the reassessment statute to its original form by authorizing the commission to order reassessments in the manner prescribed by the statute when conditions disclosed manifestly call for that course. An amendment to the law in this respect would prove a material aid in securing more equitable assessments and a fairer distribution of our constantly increasing tax burden.

## CHAPTER III

### INCOME TAX LEGISLATION RECOMMENDED

#### Repeal of the Personal Property Tax Offset

The tax commission has twice recommended the repeal of the personal property tax offset provision, first in its biennial report of 1916, and then in its report of 1918, and renews the recommendation in this report.

Out of the ten or fifteen states that have enacted income tax laws, Wisconsin and North Dakota are the only ones that permit taxes paid on personal property to be used as an offset to income taxes. North Dakota in framing its income tax law adopted substantially the offset provision in the Wisconsin law. Hence, no sanction for the offset can be found in the legislation of other states. We must look to our own experience in the past to guide us in the future.

The provision under discussion reads as follows:

Section 1087m—26. Any person who shall have paid a tax assessed upon his personal property during any year shall be permitted to present the receipt therefor to the tax collector, together with any similar receipts for personal property taxes paid by members of his family whose incomes have been assessed to him, and have the same accepted by the tax collector to their full amount in the payment of income taxes assessed against such person during said year; provided that no receipt for taxes paid on the shares of stock in any state, national or mutual savings bank or trust company shall be allowed as an offset against any income tax within the meaning of this section. If in any year a person failed or neglected, or, shall in the future fail or neglect, to present his personal property tax receipt in payment of income tax as provided by this section, and the council of the city or board of the town or village to which such taxes shall have been paid is satisfied that such person was entitled to such offset, and that by reason thereof, such person has paid to the town, city or village an amount in excess of that which he was legally obliged to pay, it may within two years after such payment remit such excess to such person without interest and charge the state and county for their respective proportions of such excess, as provided in section 1164.

The first assessment of incomes in this state was made in 1912. The tax on this assessment was collected in 1913. The last assessment of which we have full data was made in 1919 and was collected in 1920.

The following table shows the amount of income tax paid in

cash in each year and the amount paid by personal property tax offset since the incidence of the law:

TABLE I.

Year Ending June 30	Total	Cash Collections	Per cent of Total	Offsets	Per cent of Total
1913.....	\$3,241,124.40	\$1,631,412.38	50.33	\$1,609,711.02	49.67
1914.....	3,831,173.66	1,935,846.54	50.53	1,895,327.32	49.47
1915.....	3,990,117.05	2,002,212.53	50.18	1,987,904.52	49.82
1916.....	3,732,083.31	1,906,441.69	51.07	1,825,641.62	48.93
1917.....	5,200,373.55	2,988,766.66	57.48	2,211,606.89	42.52
1918.....	9,345,154.86	6,037,719.19	64.61	3,307,435.67	35.39
1919.....	11,658,670.66	6,951,482.70	59.62	4,707,187.96	40.38
1920.....	11,814,982.88	6,243,376.47	52.85	5,571,606.41	47.15
Totals..	52,813,680.57	29,697,259.16	56.23	23,116,421.41	43.77

From the above table it appears that during the period of state income taxation, there has been collected \$52,813,681, of which \$23,116,421, or 43.77% of the whole, was paid with personal property tax receipts and yielded no income. That is to say, on an average approximately \$3,000,000 of assessed income tax has been annually forgiven taxpayers and stricken from the rolls because, forsooth, they were the fortunate possessors of some millions of dollars of personal property as well as the recipients of this vast amount of income. But for the operation of the offset, the revenue actually available for public expenditures during the last eight years would have been increased from income taxation by over \$23,000,000 and the general property tax decreased by the same amount.

We submit below another table showing the total personal property tax offset used in cities in comparison with that used in towns and villages during the years 1916 to 1920 inclusive.

TABLE 2

	Total Offset Used	Total in Cities	Total in Towns and Villages
1916.....	\$1,825,641.62	\$1,503,065.80	\$322,575.82
1917.....	2,211,606.89	1,916,309.75	295,297.14
1918.....	3,307,435.67	2,885,658.93	421,776.74
1919.....	4,707,187.96	3,828,618.67	878,569.29
1920.....	5,571,606.41	4,666,771.79	904,834.62
Totals.....	\$17,623,478.55	\$14,800,424.94	\$2,823,053.61

It appears from the above data that the total offset used in the years 1916 to 1920 was \$17,623,479, of which \$2,823,054 was used in towns and villages and \$14,800,425 in cities. In percentages, approximately 16% of the whole was used in villages and towns and 84% in cities.

**TABLE 3**

21. Other Occupations.....	12,545	6.07	18,874,692.50	8.04	333,059.03	8.39	26.55
<b>Total for State.....</b>	<b>206,626</b>	<b>100.00</b>	<b>\$234,613,347.80</b>	<b>100.00</b>	<b>\$3,969,371.52</b>	<b>100.00</b>	<b>19.21</b>

From this statistical information it follows that the repeal of the offset provision would bear more heavily on the city population where large incomes are produced than on the country population where incomes are relatively small. What is said above applies to corporations with even greater force than to individuals as with few exceptions corporations producing taxable income are located in cities.

Income tax Table 3 shows the number of individual income taxpayers in the state and classifies incomes from \$1,000 to \$100,000, and Table 4 classifies taxpayers by vocations and shows the amount of tax assessed in each vocation.

500,000-1,000,000.....	23	.33	16,065,896	11.96	960,233.10	12.98	41,749.26
1,000,000 and over.....	12	.17	20,608,754	15.36	1,216,536.60	16.46	101,378.05
Total of all groups.....	6,921	100.00	\$134,191,896	100.00	\$7,390,439.12	100.00	\$1,067.83

From table number 3, it will be noticed that the total number of individual taxpayers in 1919 with taxable incomes of \$1,000 or less was 146,015, and the average tax assessed against each was \$4.00+. The total number assessed was 206,626. On this basis, should the family exemption be increased to \$2,500 or more, as is proposed, all taxpayers with less than \$2,500 of net income would not in the future be assessed. This will reduce the total of taxable persons to something less than 60,000.

While the total number of farmers in the state on January 1, 1920, was 189,000 according to the U. S. Census report and 182,000 on January 1, 1919, according to our own department of agriculture, only 35,000 were assessed for income tax, and of these the average tax was only \$15.00+, as appears from Table 4. The average assessment was \$1,209. With the proposed increase in family exemption, assessment against farmers would, therefore, practically disappear. The same may be said of laborers or wage earners, and to a large extent, professional men and women.

Referring to Table 6 it will be found that the total number of corporations assessed in 1920 was 6,921; that the total tax assessed was \$7,390,439; and that of this amount 85.14% was assessed to 802 corporations.

The conclusions to be drawn from the foregoing statements are:

First, that the proposed repeal of the offset in its practical operation would affect in the main, city taxpayers to the exclusion of taxpayers in villages and towns;

Second, that it would not materially add to the tax burdens of farmers, laborers, or in any large number, of salaried or professional men;

Third, that the increased burden from its repeal would fall principally on merchants, manufacturers, capitalists, and others enjoying large incomes.

What is said above is not presented so much as an argument for the repeal of the offset provision as to present certain facts in connection therewith that should be considered, showing what the proposed repeal would mean in revenue, and the localities and classes of taxpayers that would be most affected thereby.

The best reason for the repeal of the personal property tax offset lies in the fact that it has no proper place in an income tax law. It is a mere device, the tendency of which is to defeat income taxation. It was introduced into the law under the pretense that it would supplant or practically abrogate personal property taxation. It claimed no other right to a place in the law. To substantiate this statement, we quote, first, from the message of the governor to the legislature upon his approval of the law at the time it was passed:

Because personal property taxation has broken down and the burden upon real estate is daily increasing, the prime desideratum

at this time is improvement in local taxation. This improvement is here attempted by providing an income tax. It comes to the people of Wisconsin, therefore, as a relief rather than as a burden; as a substitute for something that has failed rather than as an additional tax.

Second, from the Wisconsin Tax Commission:

Those who followed the agitation will recall that one of the common arguments in favor of the income tax was that it should displace the personal property tax.

Third, from the opinion of the Supreme Court, sustaining this provision of the law. Referring to the enactment of the offset provision, it said:

It was evidently done with the idea of accomplishing without too violent a shock to taxing machinery a substantial elimination of personal property taxation and the substitution therefor of ability taxation.

Again:

By the present law it is quite clear that personal property taxation for all practical purposes becomes a thing of the past. The specific exemptions of all money and credits and the great bulk of stocks and bonds, as well as of all farm machinery, tools, wearing apparel, and household furniture in actual use, regardless of value, goes far to eliminate taxation of personal property while the provision that he who pays personal property taxes may have the amount so paid credited on his income tax for the year seems to put an end to any effective taxation of personal property. That taxation of such property has proven a practical failure will be admitted by all who have given any attention to the subject. Doubtless, this was one of the main arguments in the legislative mind for the passage of the present act. By this act the legislature has in substance declared that the state's system of taxation shall be changed from a system of uniform taxation of property (which so far as personal property is concerned has proven a failure) to a system which shall be a combination of two ideas; namely, taxation of persons progressively according to ability to pay and taxation of real property uniformly according to value.

That upon the passage of the income tax law, personal property taxation would be substantially eliminated from our tax system seems to have been the accepted theory of the legislature which passed the law, the governor who approved it, the court which declared it constitutional, and the tax commission which afterwards administered it. And it should be particularly noted that the offset provision, when attacked as unconstitutional, was sustained by the court on the sole ground that it would work a substantial elimination of personal property taxation.

Experience, however, has proved the utter groundlessness of the claim. The income tax with the offset has never been, and

never will be, a substitute for personal property taxation. It has fallen so far short of it as to make the promise that it would abrogate personal property taxation seem a mere travesty. We wonder now how such an idle promise could ever have been made or seriously considered as affording sufficient ground for introducing the provision into the law or sustaining it as constitutional. In 1911 before the income tax law was in force, the assessment of personal property in the state was \$366,386,379, and the tax thereon at the average local rate was \$6,262,000. In 1912, notwithstanding the exemption from taxation of moneys and credits, farm machinery, household furniture, etc., exempted by the income tax law, the personal property assessment was \$356,629,923, the tax on which at the average local rate was \$5,765,000, of which \$1,609,711 was used as offset to income tax and the balance was collected in cash, leaving \$4,154,289 of personal property tax for which the income tax was not in that year a substitute. In 1917, the assessment of personal property on the local roll was \$570,941,372 and the tax at the average local rate was \$9,308,000, of which \$3,307,435 was used as an offset to income tax, leaving \$6,563,000 which was not used in that year as a substitute for income taxation. In 1919, the total tax levied on personal property was \$15,208,000, of which \$5,571,606 was used as offset to income tax, leaving \$9,637,000 for which income tax was not in that year a substitute.

Thus it will be seen that the assessment of personal property has steadily increased since the income tax law was adopted and that, after allowing for all personal property tax offsets, the amount actually collected in cash in 1920 exceeded by more than \$3,000,000, the total amount of personal property tax assessed before the adoption of income taxation.

The offset provision, therefore, has proved an utter failure so far as accomplishing its purpose is concerned, and experience having shown that it found its way into the law, so to speak, under false pretences, why longer retain it?

If it is desired to eliminate the personal property tax from our system of taxation, the obvious way to do so is to enact suitable legislation, repealing the personal property tax laws. In its biennial report of 1914, the commission discussed this subject quite fully. It summed up its discussion by saying,

The commission believes that far greater simplicity in administration and reduction of public expense as well as a more equitable distribution of the tax burden will result if all personal property be exempted from the general tax roll. Such a course would require a revision of the statutory classification of property.

But there are many other reasons calling for the repeal of the offset provision, to some of which attention is briefly called.

First, during the 1919 session of the legislature, an exhaustive

hearing was had before the Taxation Committee of the Assembly on the proposition to repeal the offset provision. Almost the entire business interests of the state were represented at the hearing in opposition to the repeal. The main argument advanced against the repeal was that it would greatly increase the tax of those persons who receive large incomes and would, in consequence, be disastrous to the commercial and industrial interests of the state. This was the fundamental objection urged at that hearing, and by a curious coincidence was exactly the same argument that was used against the enactment of any income tax law. It deserves no more attention than it did in 1911. The predicted disaster did not follow the enactment of the original law, and it is safe to say it will not follow the repeal of the personal property tax offset. True, it must be conceded, as claimed, that the repeal of the offset will in many cases increase the tax burden of those enjoying large incomes, but it will seem to many that this is the very reason why it should be repealed. Its repeal simply means taxing the opulent and fortunate possessor of a large income in accordance with the admittedly just principle of "ability to pay" and by that much relieving the less opulent and less fortunate man upon whose income or property any tax strains the "ability" principle to the limit.

Second, the offset is not in keeping with uniform, graduated, and progressive taxation in accordance with the constitutional amendment adopted by the people. It is true that in the first section the law declares boldly that, "There shall be assessed, levied, collected and paid a tax upon incomes received during the year ending December 31, 1911, and upon all incomes received annually thereafter," etc. But strangely, the offset section introduced in the last part of the law, apparently as an afterthought, provides that nearly one-half of the tax lawfully assessed and levied need not be collected and paid. The result is to place a tax burden on one income and exempt another of the same size, either in whole or in part. To illustrate, A, B, and C are each assessed an income tax of \$75. A owns a Cadillac upon which the tax is \$75; B owns a Hudson upon which the tax is \$50; C, being in more moderate circumstances, is not the owner of an automobile and has no personal property tax. A, the owner of the Cadillac pays no income tax at all; B, the owner of a Hudson, pays a tax of \$25; but C who is unable to afford an automobile pays a tax of \$75. Thus, a person with a large income must pay a tax on all of it or part of it or on none of it, just according to the amount of personal property he may have been fortunate enough to accumulate. In other words, the amount of income tax a person must pay is measured not by the amount of income received but the amount of personal property owned. Taxation under the personal property tax offset is the reverse of "ability taxation." The

more one has of this world's goods, the less his income tax. This is progression and graduation in the wrong direction and is certainly not what is meant by the constitutional amendment when it said, "Taxes may be graduated and progressive." Indeed, it is difficult to reconcile on any principle of justice the taxing of one person on personal property and another person on income and where the income received and the personal property is owned by the same person, taxing one and exempting the other. If both are proper subjects of taxation, both should be taxed regardless of ownership. If one or the other is not a proper subject of taxation, it should not be taxed at all.

Third, the offset discriminates against real estate owners. Real estate taxation cannot be used as an offset against income taxation. Is this just? We can find no reason why, when one person engaged in manufacturing, owning his own building and machinery, both being assessed as real estate, no offset is allowed, while another engaged in the same kind of business, occupying and renting a building, owning his own machinery assessed as personal property, pays no income tax. Both enjoy the same income, conduct the same kind of business, but the one who owns his own building is precluded from using the tax paid on it as an offset to his income tax while the other is permitted to use his personal property tax receipt to extinguish his income tax. In short, one person pays a tax on his income and the other, under practically the same circumstances, pays none.

Fourth, another serious inequality is caused by the difficulty in properly administering the offset. Those who have income taxes to pay are interested in having as much of their taxable property as possible assessed as personal property. It is well known that local assessors are pressed by taxpayers to assess machinery and other fixtures as personal property while the law denominates such property as real estate. Assessors with their proverbial tendency to follow the lines of least resistance in the performance of their official duties too often yield to the pressure. The result is that large amounts of property which should be assessed as real estate are assessed as personal property and used as offsets to income tax. One taxpayer gets the benefit of the good nature of the assessor while his neighbor receives no such favor. There is no protection against this abuse. Illustrative of this criticism, attention is called to the recent case of *State of Wisconsin ex rel Gisholt Company vs. O. S. Norsman*, reported in 167 Wis. 429, in which the lower court held that certain property assessed as real estate at \$301,173 should have been assessed as personal property. In reversing the lower court, the Supreme Court said:

The relators contend and the circuit court held that this machinery is personal property and should have been so assessed. This presents the main question for consideration. It is import-

ant because if the property assessed is personalty, the tax thereon operates as an offset to the income tax paid by the relator.

The Supreme Court restored to the real estate assessment roll over \$300,000, resulting in largely decreasing the offset which the relators would otherwise have enjoyed, and which doubtless it improperly had enjoyed in previous years. This is only an example of many instances of similar nature that might be cited in which the public has been unlawfully deprived of large amounts of income tax by the placing of real estate on the personal property tax roll through the ignorance or indifference of assessors. One assessor makes a lawful assessment; another, an unlawful one; and one taxpayer pays a larger tax than he should, and another a smaller one. This discrimination might be avoided, of course, if each taxpayer would see to it that his assessment was properly made, but so prone is human nature to avoid taxes that no such ideal condition can be expected in the near future. Until this happy time arrives, revenue laws to be effective must be strict in their terms, even to harshness, and be strictly enforced by tax officers.

Fifth, the question of the repeal of the offset should be considered in connection with increasing public expenditures. How are such increases to be provided for,—in part by a larger tax on incomes, or wholly by a larger tax on property? In 1910, state, county, and local taxes levied on general property amounted to \$30,675,518. In 1919 the levy was \$77,128,834, an increase in ten years of \$46,453,316. As previously stated, had there been no personal property tax offset, this enormous increase in property taxation might have been decreased by over \$23,000,000. Property tax levies are increasing at the average rate of over \$4,600,000 a year and are quite likely to increase still further. If the offset provision shall be repealed, something over \$3,000,000 annually may be expected from income taxation over that now received from that source, which, assuming that public expenditures have reached the maximum, will reduce property taxation by the same amount. Assuming that the rate of increase in public expenditures will continue, the additional income tax would, at least, meet in part, such increase and help hold down property tax rates.

Sixth, in addition to the foregoing objections, the unnecessary expense which the offset incurs is one well worth considering. It has been shown that 43.77% of all income tax levied during the last eight years was paid by personal property tax receipts and yielded no income. All the time consumed and the expense incurred in assessing nearly one-half of all income tax represents sheer waste. The tax commission and the assessors of incomes must, of necessity, devote as much time to the assessment of taxes extinguished by the offset as those that are to be collected. They must all pass

through the same channel. Returns must be made by taxpayers, the income assessed, the tax computed and certified to the county clerks of the various counties of the state and by them, in turn, certified to the town, city, and village clerks, and by them to town, city, and village treasurers at which point they disappear. From the beginning to the end, the income tax assessed which is extinguished by the personal property tax offset represents useless expense, both of time and money.

In brief, the reasons urged by the commission for the repeal of the offset provision may be restated as follows:

First, it is entirely foreign to any true conception of income taxation and tends to defeat rather than to promote that form of taxation;

Second, it is wholly inconsistent with "ability taxation";

Third, it deprives the state and the municipalities therein of large revenue to which they are justly entitled;

Fourth, it favors those best able to pay and is discriminating between taxpayers;

Fifth, in administration it entails a waste of public funds.

#### **Individual Incomes, Assessment of**

Under the law only such income as is derived from sources within the state is subject to taxation. In all countries where the income tax law is in force, income of their own citizens whether earned at home or abroad is subject to taxation. Under the federal income tax law, income received by subjects of this country is taxed notwithstanding a part or all of it may have been derived from property or business located abroad. Other precedents may be found in the recent personal income tax laws of Massachusetts, New York, Oklahoma, and Connecticut, all of which provide for the taxation of all the net income of individual residents regardless of the source from which derived. We recommend the incorporation of this principle in the Wisconsin law so far as it applies to individuals.

#### **Exemptions**

We recommend a change in the section providing for family exemptions, extending the exemption to nonresidents having taxable income in this state, to conform to the recent decision of the Supreme Court of the United States wherein it was held that a provision in the income tax law of New York identical with that in Wisconsin, denying exemption to nonresidents, violated Section 2 of Article 4 of the United States Constitution and was null and void. *Travis vs. Yale and Towne Manufacturing Co.*, 252 U. S. 60.

While there is warrant for an increase in the family exemptions under present economic conditions, the commission refrains from making any specific recommendation on the subject. In passing, however, it may be said that a material increase in such exemption

- would cause a material decrease in the number of taxable persons and a consequent decrease in taxable income. This loss, however, will in all probability be more than made up if the foregoing proposed changes are adopted, especially if such legislation shall be supplemented by a moderate increase in rates of taxation on individual incomes.

#### **Bank Dividends**

In the event that the personal property tax offset provision shall be abolished, we recommend that the provision of the law exempting bank dividends from taxation be repealed and such dividends be taxed as other dividends are taxed.

#### **Publicity**

Much has been said and written in advocacy of publicity of income tax returns. Some advocate making the returns public records open to the inspection of everybody under the same rules and regulations as other public records and documents are open to the public. This is strongly objected to on the ground that income tax returns should be treated as confidential communications and used only as a basis for taxation. This was undoubtedly the original conception of the authors of the law and the legislature which enacted it. The commission is of the opinion that a middle ground may now fairly be taken. It is believed that income tax returns contain valuable information which might well be made available for statistical purposes and as a guide to legislation along lines of taxation and for other legitimate purposes. During the last year, the Division of Markets and certain civic bodies have sought for information for the purpose of more effectively carrying on their respective activities but the commission has been obliged to withhold it because of the secrecy clause in the law. While the commission does not believe it wise to open up the returns to the general public, it is of the opinion that access to them may properly be given, at least, to other departments of state for proper purposes under appropriate rules and regulations.

#### **Dividend Deductions, Limitation of**

The income tax law provides that dividends paid out of earnings of a corporation shall be exempt from taxation when received by stockholders to the extent that such earnings have been taxed. In analogy with the federal surtax act, it is suggested that the dividend deduction allowed individuals be reduced to \$5,000. Should this recommendation be followed, it is predicted that the income assessed will be considerably greater and that those individuals whose taxable incomes are increased will, with the exemption of \$5,000 plus the family exemption, have sufficient income left untouched by tax upon which to live in comparative comfort. To illustrate what is meant by this recommendation, assume that a

man has an income of \$10,000, all in dividends from Wisconsin corporations. Under the law he would be allowed first, a family exemption of \$2,500—assuming that the exemption shall be increased to that amount. To this, there would be added a dividend deduction of \$5,000, making a total of \$7,500, leaving a taxable income of \$2,500, the tax on which at present rates would be \$30. This certainly would be no hardship.

#### **Rates, Increase In**

No increase in the rate on corporation incomes is recommended. The weight of the increase in taxation by reason of the repeal of the offset provision will fall heavily on corporations and will probably place on them all the additional tax burdens they ought to bear. There is a limit beyond which corporations, if they are to exist and remain in the state, ought not to be taxed.

There is no law requiring corporations to maintain a corporate existence in this state, or to compel persons doing business here to incorporate, and it may be taken as an accepted truth that when corporation taxes get so high as to make it profitable for corporations to emigrate or dissolve, they will not hesitate to do so. The State of New York seems to have recognized this principle in framing its corporation income tax law by exempting from taxation all personal property owned by corporations taxable thereunder.

The commission does, however, recommend that the rate of taxation on individual incomes be increased to correspond at least with the rate now in force on corporation incomes. We can see no reason why an income whether received by a corporation and an individual should not bear the same rate just as the same rate of taxation is applied to real and personal property whether owned by an individual or corporation.

In connection with the foregoing recommendation, attention is directed to the character of income tax legislation that has been enacted since the income tax law was originally adopted. In general, it may be said that such legislation either granted new deductions, enlarged old ones, or restricted the meaning of the term "income" so as to exclude what was before taxable.

In detail, these laws are:

1. Chapter 615, laws of 1913, (a) exempting bank dividends from taxation; (b) exempting from taxation the income of banks, trust companies, and building and loan associations.
2. Chapter 253, laws of 1915, which added to the list of deductions "all inheritances, devises, bequests, gifts", and practically all life insurance.
3. By Chapter 247, laws of 1917, the term "dividends" was defined to mean "any distribution made by a corporation out of earnings or profits accrued since January 1, 1911, and paid to its share-

holders whether in cash or in stock." Previous to the enactment of this amendment, dividends were taxable to shareholders receiving them whether earned before or after January 1, 1911. Since the passage of this act, corporations frequently have confined their distribution of profits in the way of dividends to surplus accrued prior to January 1, 1911, and thereby, have withdrawn from taxation a very large volume of income. And in all cases of liquidation, surplus accumulated prior to January 1, 1911, now goes to stockholders free from all tax liability.

4. Chapter 248, laws of 1917, fixed the basis of determining profits on the sale of capital assets acquired before January 1, 1911, as the fair market value thereof on January 1, 1911. Since the passage of this amendment, a general disposition on the part of taxpayers has been manifest in the case of sales of property acquired prior to January 1, 1911, to vigorously insist that the fair market value as of January 1, 1911, was equal, and in many cases greater, than the amount received on the sale.

5. Chapter 374, laws of 1917, exempted from taxation the estimated rental of the homestead occupied by the owner.

6. Chapter 231, laws of 1917, increased the deductions by adding cash bonuses paid employees and practically all interest paid by corporations, while previous to this amendment a corporation, could not deduct interest on an indebtedness in excess of its paid up capital stock.

7. Chapter 147, laws of 1919, made further inroads on the income tax by making contributions and gifts to religious, charitable, scientific, and educational associations deductions from income.

8. Chapter 435, laws of 1919, added to the list of deductions excess profits and war taxes paid to the United States government. The effect of this amendment is evident in the assessment of incomes for the year 1920, the assessment of that year being less than that of 1919 by \$658,246.

Thus it will be seen that the whole tendency of recent legislation has been to limit the scope of the income tax law and reduce its yield. We do not say this in the way of criticism for most of these amendments have been enacted at the suggestion or with the approval of the tax commission. The point we want to emphasize is this: That almost every amendment offered which would in any manner lighten the burdens of income taxpayers has been enacted, while amendments suggested that would tend to increase the revenue from income taxation have been rejected. Clearly, if this process of elimination of taxable incomes goes on long enough and no substitute is adopted, the Wisconsin income tax law will become a mere shadow.

We point out the danger at this time because the period of declining incomes has arrived. For four years incomes have been

abnormally large and the effect of the legislative program has not been materially felt but with the reversion to something like normal incomes we will get its full force, and the net revenue from income taxation will show a marked falling off because of the amendments referred to, and this at a time when public expenditures are rapidly increasing.

As a matter of information, attention is called to the following classes of corporations whose income is wholly exempt from taxation by express statute, Sec. 1087m—5, paragraphs 2 and 3. Whether or not the exclusion of some of these classes from the operation of the law should be continued longer is a question that is submitted for consideration.

- State banks
- National banks
- Mutual savings banks
- Trust companies
- Mutual loan corporations
- Building and loan associations
- Religious, scientific, educational, benevolent, or other corporations or associations not organized for pecuniary profit
- Railroad companies
- Palace and sleeping car companies
- Freight line and equipment companies
- Express companies
- Street railway companies including connected electric light, heat and power companies
- Telegraph companies
- Fire insurance companies
- Life insurance companies
- Accident, surety, etc. companies
- Telephone companies
- Title guaranty companies
- Conservation and regulation companies.

These recommendations are made in pursuance of the mandate of the law which requires the commission "to investigate the tax systems of other states and countries and to formulate and recommend such legislation as may be deemed expedient to prevent the evasion of assessment and tax laws, and to secure just and equal taxation and improvement in the system of taxation in the state."

## CHAPTER IV

### THE INCOME TAX AS A SOURCE OF MUNICIPAL REVENUE

An Address Delivered by Thos. E. Lyons of the Wisconsin Tax Commission Before the League of Minnesota Municipalities At  
Bemidji June 17, 1920

#### INTRODUCTION

Income taxes are based upon the principle of contribution to the support of the government in proportion to ability to pay,—a principle nearly as old as the history of public finance. With the single exception of the poll or capitation tax, every system of taxation which has ever been widely used dimly recognized this principle. The tithes of Biblical times, the Roman or Italian *estimo*, the French *dixieme*, the English tenth and fifteenth, and the more modern taxes on production, consumption and general property, were all designed as rough measures of ability to pay. Indeed, the history of public finance represents little more than the successive steps in the evolution of this principle and the income tax marks its latest and most perfect development. The income tax, therefore, is neither new nor experimental in principle but an old and well established form of taxation, developed in recent times into a great branch of the science of public finance.

While the principle underlying this form of taxation was early recognized, it was not until 1842 that income taxation in its modern form was fully developed and established. The English act of that year introduced by Sir Robert Peel, to compensate for the loss of revenue resulting from the repeal of the corn laws, is the parent of all modern income taxes. Although this act was intended to meet a special emergency with an express promise of repeal as soon as the emergency should have passed, the English government has never been able to repeal it, and the income tax now constitutes the keystone of the arch of the British fiscal system. The permanent adoption of income taxes in England was followed by various attempts to introduce the tax in Germany, resulting in the Prussian act of 1891, which was soon followed in many other German states.

Within the last half century the taxation of income has been introduced in all the advanced countries of the world, and is now in successful operation in England, Germany, France, Belgium, Denmark,

Norway, Sweden, Holland, Italy, Switzerland, Hungary, India, Japan, Russia, Hawaii, Canada, New Zealand, Austria, and the United States, or in some of the states, provinces or political subdivisions of these countries. The income tax has the sanction of economists, legislatures, and courts throughout the world, and a long precedent of successful operation under widely varying conditions. In view of this record, the presumption is strongly in favor of this form of taxation, and the burden of proof rests heavily on the shoulders of its critics to make good their claims.

While so-called faculty taxes found favor and were employed in some of the American colonies during the colonial period, the general property tax was the common and general method of raising revenue, and became the prevailing system in all the American states. This form of taxation was well suited to agricultural communities and primitive conditions, while the forms of property were simple, and the problems of administration few. But as personal property increased in quantity and assumed more complex forms, the defects in the general property tax became apparent. Nevertheless, that form of taxation was so firmly established as to preclude the adoption of the income tax or other substitute for many years.

#### THE INCOME TAX IN THIS COUNTRY

A federal income tax was adopted in 1862 to meet the expenses of the Civil War, and was continued with frequent changes until 1871. During the existence of this law a total yield of about \$375,000,000 was derived. In 1894, Congress enacted a general income tax law which the United States Supreme Court later held unconstitutional in the case of *Pollock vs. Farmers Loan & Trust Company*, 157 U. S. 429; 158 U. S. 601. Soon after this decision was rendered steps were taken to amend the constitution in this respect, resulting in the adoption of the sixteenth amendment in 1913, permitting the taxation of incomes without apportionment according to population. In 1909, Congress provided for a tax of one per cent on the net income of corporations which was in effect an income tax as to them, and this act was sustained by the Supreme Court as an excise tax in the case of *Flint vs. Stone Tracy* 220 U. S. 107. The federal act of 1913, followed by the revisions of 1916, 1917 and 1918, marks the general, and I believe, permanent introduction of income taxation in this country.

Several of the southern states resorted to the income tax to meet the extraordinary expenses of the Civil War, and derived substantial revenue therefrom. But few, if any, of these laws applied to all forms of income; as a general rule, the tax was confined to special classes of income and profits derived from sources not otherwise taxed. The radical defect in all these laws was the lack of adequate machinery of administration. In each case the administration was committed to local assessors, and while under the stress of war conditions substantial revenue was produced, when peacetime returned, the administration became lax, and the yield of the tax negligible. The

states of Virginia, North Carolina, and Louisiana still retain remnants of these war time taxes, but derive little revenue therefrom. South Carolina repealed her war time tax in 1917. As a result of these conditions, the impression became general, that while an income tax may be suitable and desirable for national revenue, it had never been and could not be effectively administered in the separate states.

#### STATE INCOME TAXES

This was the situation when the Wisconsin income tax law was adopted in 1911,—widespread disbelief in the practicability of the income tax for state purposes and strong opposition to its adoption. The comparative success of the experiment here and the substantial revenue produced under the law contributed largely to a change of attitude in this respect, and in recent years, the income tax has been constantly growing in favor as a source of both state and federal revenue. The remarkable record of income taxation during the late war assures the continuance of the system as part of our national fiscal policy.

According to the latest available information, twelve American states now have income tax laws in one form or another, and seven of these have been adopted since the Wisconsin law was passed. These laws differ widely in scope and detail, and are not of equal importance. For example, the taxes imposed by the laws of West Virginia, Connecticut and Montana are in the nature of excise or business taxes on the net income of corporations at moderate rates. The laws of North Carolina and Virginia are survivals of the Civil War acts of these states, although that of Virginia has been modified and extended. The late Alabama income tax law has been declared unconstitutional, and the New Mexico act of 1917, was repealed by the legislature of 1919, but the governor vetoed the repealing act, and no attempt to apply the law has yet been made. The high Exemptions under the Oklahoma law materially reduce the yield of that act. The Mississippi, Missouri and North Dakota laws are so recent that no statistics of results are yet available, and we are therefore primarily confined to Wisconsin, Massachusetts and New York for examples of comprehensive state income tax laws, and their results in operation.

Understanding that Minnesota is considering the adoption of an income tax, and that the League of Municipalities is desirous of obtaining information in reference thereto, it may be profitable to devote the time at our disposal to a consideration of (1) the nature and distinctive characteristics of an income tax, (2) its effect upon the increase or decrease of the total tax burden or in the cost of government, (3) whether the adoption of an income tax in one state operates to the disadvantage of its people or handicaps business in comparison with neighboring and competing states having no such tax, (4) the productiveness of income taxes in general as sources of public revenue and particularly in urban districts.

## NATURE OF TAX

The cardinal virtue of an income tax as compared with other kinds of taxes is that it is based upon the net income received by the taxpayer, after deducting all expenses incurred in producing it. It applies only to profits realized during the year which are available to the taxpayer for expenditure or reinvestment, and is therefore the best measure of his ability to pay. As no tax is imposed until a net income is realized and the burden is then graduated in proportion to the amount of such income, the income tax automatically adapts itself to changing conditions of business. If there is no income for any given year, there can be no tax; if a moderate income, there will be a moderate tax, and if a large income, a large tax. New enterprises are thus relieved of heavy burdens during their lean and struggling years, moderately successful concerns pay in proportion to their profits and only the highly successful are required to pay a heavy tax. The advantages of such a system to mercantile, manufacturing and other lines of business of irregular yield is self-evident. In addition to these considerations the income tax taps sources of revenue which cannot be reached by the property tax, such as salaries, commissions, professional fees, profits derived from the sale of capital assets, and many other forms of gain. As the tax is neither levied nor collected until after the profit has been made, it cannot be added to the price of property sold, nor readily shifted to the consumer. It has the further merit of being well suited to the unusual emergencies as demonstrated by the wide use made of it in all the belligerent countries during the world war.

## FEDERAL WAR REVENUE ACTS

The taxation of income was comparatively new and untried in this country when the United States entered the war, but the revenue act of 1917 produced an aggregate yield of \$3,700,000,000 from this source during the first year of its operation, by far the greatest amount of revenue ever raised by any one country in a single year during the entire history of the world. The revised act of 1918 produced approximately \$6,000,000,000, or 50% more than the high water mark of the preceding year, and about 60% of the yield of each of these years was produced by the income and excess profits tax. Whatever else may be said of our American profiteers, it cannot be truthfully claimed that they were favored in the matter of taxation, or escaped without heavy contributions to the cost of the war. On the contrary they contributed more of their unholy spoils for public purposes than their brethren anywhere else in the world. In the face of this record and in view of the fact that war times prices still prevail and public expenditures are still heavy, there is every reason to believe that the

taxation of incomes will be continued as a permanent feature of our national fiscal system.

#### OBJECTIONS TO STATE INCOME TAXES

But it has been and will be said that while an income tax may be all right for national purposes, it is unsuited to and impracticable for individual states. Various objections are urged in support of this contention, many of them plausible, some of them substantial, but most of them superficial and few, if any, wholly sound. The first and most valid of these objections is the difficulty of separating the income produced in different states. Modern commerce pays little heed to state boundaries, and most commercial concerns of any magnitude conduct business in more than one state. The difficulty of allocating this income to the state of its origin is a real one, and may be flatly acknowledged. It is not insuperable, however, nor is it confined to income taxation alone. The same problem arises in the administration of inheritance tax laws and in the assessment of interstate railroads and other public utilities under the general property tax. It also arises in the regulation of public service companies where national and state jurisdictions conflict, and in administration of pure food laws and other exercises of the police power. Although difficult the problem has been met in these fields. Recent decisions of the United States Supreme Court on assessments made under state income tax laws go far to remove this objection, and indicate that the principles already established in dealing with interstate problems under the property tax, rate regulation and pure food laws will be applied to the taxation of incomes.

Another common objection is that the existence of an income tax in a given state operates as a handicap to business and an additional burden on its citizens in competition with rivals in states where no such tax exists. But this objection does not stand the test of analysis on either theoretical or practical grounds. The people of every community must raise whatever revenue is required to maintain their own government. Whether they use one or many methods of taxation for that purpose is wholly immaterial. The system of taxation employed can neither increase nor decrease the amount of revenue required in any given community. Nearly all communities have more than one form of taxation and to the extent that part of the necessary revenue is raised by one system, it is reduced on others. This principle is axiomatic on *a priori* grounds, and it is equally clear as a matter of actual practice, as a few illustrations will show.

#### EXPERIENCE ELSEWHERE

There are many examples of the existence of an income tax in one or more of several competing communities without similar tax

in the others. For instance, the Prussian income tax was adopted in 1891, and the example was followed from year to year by other German states, but the taxes adopted in the different states were of unequal weight and unlike in many respects, and no income tax was ever adopted in several of the states. The same is true of the cantons of Switzerland. The income tax was widely used among several of the Swiss cantons during the latter part of the nineteenth and early years of the twentieth centuries, but five of these cantons never adopted an income tax. These German states and Swiss cantons were in direct competition with each other, and so far as known no claim was ever made, much less maintained, that the absence of an income tax in some of these states and its existence in others operated to the disadvantage of the latter. On the contrary, each state and canton felt at liberty to adopt whatever method of taxation seemed best suited to its needs, and no reason is apparent why that course may not be followed in the United States.

## TAX LEVIES IN WISCONSIN AND IN ADJOINING STATES

As further evidence to the same effect attention is called to the following tables containing a statement of the assessments and tax levies of Wisconsin and the four surrounding states for the years 1917, 1918 and 1919.

COMPARISON OF ASSESSMENTS IN WISCONSIN AND ADJOINING STATES  
FOR 1917, 1918 AND 1919

1917				
	Population	Area in Square Miles	Assessed Value	True Value
Illinois.....	6,214,310	56,665	2,577,990,810	7,733,972,430
Iowa.....	2,224,771	56,147	1,305,342,487	4,231,506,108
Michigan.....	3,113,972	57,980	4,304,818,117	4,304,818,117
Minnesota.....	2,298,761	84,682	1,951,252,019	4,770,780,542
Wisconsin.....	2,540,575	56,066	3,073,186,438	3,607,470,442
1918				
Illinois.....	6,297,049	56,665	2,626,084,386	7,878,253,158
Iowa.....	2,224,771	56,147	1,444,078,579	4,468,107,928
Michigan.....	3,153,383	57,980	4,497,794,878	4,497,794,878
Minnesota.....	2,331,603	84,682	2,110,177,131	5,125,300,906
Wisconsin.....	2,567,391	56,066	3,326,009,413	3,846,263,744
1919				
Illinois.....	6,485,098	56,965	4,110,174,907	8,220,349,814
Iowa.....	2,403,630	56,147	1,557,417,972	4,935,888,000
Michigan.....	3,667,222	57,980	4,503,980,981	4,874,452,045
Minnesota.....	2,386,371	84,682	1,803,065,035	4,068,268,534
Wisconsin.....	2,631,839	56,066	3,545,232,808	

The above table gives the population of each state as estimated by the census bureau for the years 1917 and 1918, and according to the 1920 census for the year 1919, the area in square miles, the aggregate assessment of taxable property therein for each year, and the true value of such property as reported by the several states or derived by dividing the aggregate assessed value by the ratio of assessed to true value prescribed by law. It will be observed that Illinois, Iowa, Michigan and Wisconsin have approximately the same area, and that Iowa, Michigan, Minnesota and Wisconsin do not differ widely in population. While Minnesota has the greatest area it had the smallest population in 1920, and of course the population of Illinois greatly exceeds that of either of the other states. All these states are, therefore, comparable in some respects, and Michigan, Minnesota and Wisconsin are closely comparable in all essential respects except area.

COMPARISON OF TAXES IN WISCONSIN AND ADJOINING STATES FOR  
1917, 1918 AND 1919

1917				
	General Prop. Tax	Other Taxes	Total Taxes Levied	Per Capita Taxes
Illinois.....	148,609,890	5,885,038	154,494,928	24.86
Iowa.....	62,381,314	1,150,763	63,532,077	28.56
Michigan.....	73,612,698	5,071,329	78,684,027	25.27
Minnesota.....	67,329,550	10,264,226	77,593,776	33.75
Wisconsin.....	50,134,005	11,383,375	61,517,380	24.21
Average per capita tax.....				27.33
1918				
Illinois.....	149,997,044	3,910,080	153,907,124	24.44
Iowa.....	66,216,151	1,150,763	67,366,914	30.28
Michigan.....	85,132,857	5,630,330	90,762,987	28.78
Minnesota.....	73,200,786	9,921,926	83,122,712	35.65
Wisconsin.....	56,271,297	15,452,941	71,724,238	27.93
Average per capita tax.....				29.42
1919				
Illinois.....	188,786,182	6,693,957	195,480,139	30.15
Iowa.....	79,872,709	622,527	80,495,236	33.49
Michigan.....	110,776,104	11,548,675	122,324,779	33.36
Minnesota.....	89,787,263*	9,735,345	99,522,608	41.69
Wisconsin.....	70,176,526*	15,244,273	85,420,799	32.46
Average per capita tax.....				34.23

\* Without bonus.

Column 1 of the above table shows the aggregate amount of general property tax levy in each of these states for the years 1917, 1918 and 1919, and column 2 shows the amount of revenue derived from all other forms of taxation for each of these years. Column 3 shows the aggregate amount of taxes of all kinds levied in each of the

states for the years mentioned, and column 4 shows the per capita tax levied in each of said states for each of the said years, together with average per capita tax of all five states for each year. It will be observed

(1) That the general property tax levy for the State of Wisconsin for each of the years mentioned was lower than that of any of the other states.

(2) That the amount of revenue derived from other forms of taxation for each of said years was greater in Wisconsin than in any of the other states, and

(3) That the aggregate amount of taxes of all kinds levied in Wisconsin for each of the years mentioned was the lowest in the entire group for the year 1917, and lower than any of the other states except Iowa for the years 1918 and 1919.

(4) That the per capita tax levy in Wisconsin was materially below the average for all five states for each of the years mentioned, lower than any of the states for 1917, and lower than any except Illinois for the years 1918 and 1919.

Why does not this favorable showing for Wisconsin effectually refute the claim that the existence of an income tax in this state operates to the disadvantage of its people as compared with the neighboring and competing states which have no such tax.

Again in 1909, the general property tax levy was in round numbers \$35,000,000 in Michigan, \$31,000,000 in Minnesota, and \$29,000,000 in Wisconsin. It will be observed that in 1919 the general property tax levy had increased to \$110,776,104 in Michigan, \$89,737,263 in Minnesota, and \$70,176,526 in Wisconsin. In other words, the general property tax levied in each of these states and its political subdivisions during this ten year period increased 140% in Wisconsin, as against 191% in Minnesota and 217% in Michigan. Wisconsin has had an income tax since 1911, but there was no such tax in either Michigan or Minnesota. Is it not reasonable to conclude that the more moderate rate of increase in the general property tax in Wisconsin is due to the yield of the income tax in that state, the amount of which would have to be levied on property, if not raised in that form? A comparison of the total amount of taxes raised from all sources in each of these states for the year 1919 confirms this contention. For example, the total amount of taxes levied in each of these states in 1919, was in round numbers \$122,325,000 in Michigan, \$99,472,000 in Minnesota, and \$85,420,000 in Wisconsin. But \$15,244,000 of the total tax levy in Wisconsin was derived from income, public service and inheritance taxes, thus reducing the property tax levy to \$70,000,000 for that year. Clearly, the effect of the income tax is reflected in this reduced property tax, and the total tax burden borne by the people of that state is no greater than that borne by the people of its neighboring states.

A more concrete illustration of this fact is shown by the experi-

ence of Wisconsin cities which receive 70% of the tax on the income produced within their borders. Thus, the total budget of expenses in the City of Milwaukee for the year 1919 was \$17,000,000, in round numbers, but a credit of \$1,500,000 was deducted from this amount as the estimated yield of the income tax, and only \$15,500,000 actually levied upon property and all other taxable sources. Plainly the income tax operated to reduce the burden that would otherwise fall upon property in that city and the same practice was followed in all the principal municipalities of the state.

#### TESTIMONY OF FEDERAL CENSUS BUREAU

Still further evidence to the same effect may be derived from the following statistics of all cities in the United States for the year ending July 1, 1918, as compiled by the Federal Census Bureau.

#### FINANCIAL STATISTICS OF ALL CITIES OF THE UNITED STATES HAVING A POPULATION OVER 500,000, SHOWING THE POPULATION, TOTAL REVENUE RECEIPTS, PER CAPITA COST FOR ALL GOVERNMENTAL PURPOSES, OUTLAY AND NON-OPERATING EXPENSES FOR THE YEAR 1918

Per Capita				
Name of City	Population	Total cost of Government	Outlays	Net Operating Expenses
New York.....	5,788,000	\$41.54	\$5.05	\$36.49
Chicago.....	2,547,000	38.45	13.13	25.32
Philadelphia.....	1,786,000	38.12	11.36	26.76
St. Louis.....	772,000	31.04	6.57	24.48
Boston.....	769,000	50.02	7.65	42.37
Cleveland.....	692,000	39.26	12.14	27.12
Detroit.....	630,000	47.19	18.13	29.06
Baltimore.....	595,000	31.43	5.41	26.03
Pittsburg.....	586,000	39.61	7.58	32.03
Los Angeles.....	550,000	42.21	8.88	33.33
Average for Group.....		40.16	8.59	31.57

FINANCIAL STATISTICS OF ALL CITIES OF THE UNITED STATES HAVING A POPULATION BETWEEN 300,000 AND 500,000 FOR 1918, SHOWING THE POPULATION AND TOTAL AND NET PER CAPITA COST OF GOVERNMENT.

Per Capita				
Name of City	Population	All Governmental Costs	Outlays	Net Operating Expenses
Buffalo.....	479,392	\$40.67	\$6.12	\$34.55
San Francisco.....	474,776	45.09	12.72	32.27
Milwaukee.....	445,008	38.86	14.64	24.23
Newark, N. J.....	418,789	49.78	7.40	33.29
Cincinnati.....	414,248	40.41	7.34	33.08
New Orleans.....	377,010	25.90	5.52	20.38
Minneapolis.....	373,448	35.89	10.26	25.63
Washington, D. C.....	371,933	39.75	9.62	30.13
Seattle.....	366,445	47.50	14.82	32.68
Jersey City, N. J.....	312,039	31.83	5.13	26.70
Kansas City.....	308,172	40.62	12.39	28.24
Portland.....	307,321	32.56	8.15	24.40
Average for Group.....		38.68	9.58	29.10

In this classification all the principal cities of the United States are divided into groups, the first consisting of all cities having a population over 500,000, and the second of all cities having from 300,000 to 500,000 population. For the ten cities having a population of over 500,000 each, the total per capita cost of government was \$40.16, and the net operating cost of government, excluding outlays, or amounts expended for permanent improvements, was \$31.57. Detroit is the only city of the three states mentioned in this group, and the corresponding figure for that city was \$47.19 as the total per capita cost of government, and \$29.06 as the per capita net operating expense. It will be observed that the total per capita cost for Detroit exceeds the average, but the net operating expense is below the average.

There are 12 cities in the next group having a population of from 300,000 to 500,000, which includes Milwaukee and Minneapolis. The average per capita cost of government in all these cities was \$38.68, and the net operating expense, exclusive of payments for permanent improvements, \$29.10. The per capita cost of all government in the City of Milwaukee was \$38.86, or 18 cents above the average, but the net operating expense was only \$24.23, or 4.17 below the average. Minneapolis also shows up well with a per capita cost of all government of \$35.89, and a per capita of \$25.63 for net operating expenses. It appears, therefore, that the net operating cost of government in the City of Milwaukee was materially below the average of both groups and the third lowest in the entire list. While neither of the foregoing tests are absolutely conclusive, the fact that they all point in the same direction strongly indicates that there is no disadvantage in the adoption of an income tax by one state even though neighboring and competing states may fail to adopt or reject the system.

## EFFECT ON BUSINESS COMPETITION

If in fact the cost of government in a state having an income tax is no greater than in states which have no such tax, it necessarily follows that the people as a whole will not suffer in competition or otherwise. But it may be said that the income tax falls mainly upon business concerns which must compete in the market with rivals in states having no income tax, and that in consequence these concerns will suffer in competition. The obvious answer to this argument is that no business concern pays an income tax until it shows a clear net profit. It follows as a necessary corollary that the competition has been successfully met and overcome before the tax attaches. The amount of the tax to which it is then subject will be graduated according to the amount of such profit.

It may well be that a prosperous concern in a state having an income tax would pay more taxes and therefore have less final profit than if it were located in a state where no such tax exists. But a fiscal system should be framed with reference to the equitable distribution of the cost of the government among all its citizens, rather than with a view to protecting a limited number of them in exorbitant profits. In view of the well known disparity in the productiveness of different classes of property, and the fact that a property tax fails to reach many profitable lines of business at all, the income tax is the most satisfactory and efficient system thus far devised of accomplishing that result.

## PRODUCTIVENESS OF INCOME TAX

A final and crucial test of every tax system is its capacity to produce revenue with a maximum of justice and a minimum of hardship to its citizens, and judged by this test the income tax easily qualifies. Reference has already been made to the great yield of the federal war revenue acts of 1917 and 1918, receipts from which aggregated in round numbers \$3,700,000,000 under the former act, and approximately \$6,000,000,000 under the latter. Of these vast sums \$2,839,000,000 were derived from income and excess profits, taxes in 1918, about \$4,000,000,000 from the same source in 1919, or nearly \$7,000,000,000 yield in a two year period. The State of Minnesota contributed to the federal government \$58,000,000 in the form of income and excess profits taxes in 1918, and \$30,650,000 from the same source in 1919. In 1917, there were over 80,000 individual residents of Minnesota subject to the federal income tax, and the number has undoubtedly increased since that time. Clearly Minnesota offers a fertile field for taxation of incomes.

Turning to the experience of state income tax laws, we note that the Massachusetts income tax law took effect on the first of January, 1917, and that the first year's operation resulted in a tax of \$12,561,000, the second year produced \$14,907,000, and the third year, with slightly increased rates, \$15,501,000. The first assessment under the New York

income tax law on 1918 income produced a revenue of \$32,871,000. In both states the amounts stated were derived from personal incomes alone, and if corporations had been included these figures would probably have been doubled. The first assessment under the Wisconsin law in 1912 produced a yield of over \$3,500,000, and the assessment has increased from year to year until it reached \$12,018,056 in 1919. The total amount of income tax assessed for the eight years during which the Wisconsin law has been in effect is \$54,164,348. All these vast sums have been produced in the states named under moderate rates without hardship to taxpayers or prejudice to business. It is clear, therefore, that the income tax furnishes a fruitful source of public revenue for state as well as for the national government.

The most cursory examination of income tax returns, and the reports based thereon, conclusively shows that the great bulk of taxable income is derived from urban centers. For example, of the \$2,839,000,000 income and excess profits taxes assessed under the war revenue act of 1917, over one billion was derived from the States of New York and Pennsylvania alone, and more than half the entire amount was derived from New York, Pennsylvania, Massachusetts and Ohio, where the great urban centers exist. Of the \$12,018,056, aggregate income tax assessed in the State of Wisconsin during the year 1919, \$3,938,500, or approximately 33%, was derived from the City of Milwaukee. \$6,497,000, or about 54% of the aggregate was produced by the nine cities of the state having a population of more than 20,000, \$8,556,077, or more than two-thirds of the entire income tax assessed was derived from the 36 cities of the state containing over 5,000 population. Experience everywhere shows that outside of mining the great incomes are derived from manufacturing, mercantile and investment occupations, and as these lines of business are almost uniformly carried on in cities, they afford the most fruitful field for income taxation. It may be said, therefore, without reservation, that the income tax affords a peculiarly productive source of revenue for urban centers.

#### TAX PAID BY RICH AND WELL-TO-DO

In 1917, 3,472,800 individual returns were filed with the federal government, and the total net income reported amounted to over \$13,652,000,000. More than three million of these reports showed a taxable income of less than \$5,000, and the aggregate taxable income reported by these was \$6,642,000,000, or approximately one half of the total amount returned. But the amount of tax paid by these three million individuals was only \$27,380,836, or about one per cent of the total. On the other hand, the 456 returns which showed a net income of more than \$500,000 each paid an aggregate tax of \$168,774,186, or about twenty-five per cent of the total. In this number were 141 returns showing a net income of more than one million dollars each, and the total amount of tax paid by this limited group was \$109,425,000, or approximately four times the amount paid by the three million small taxpayers, whose net income was less than \$5,000 each.

The total number of income taxpayers great and small was less than three per cent of the population and one per cent of that number paid over 99% of the total tax. The operation of state income tax laws as far as results are available, furnishes further proof that the great bulk of all income tax is paid by the rich and well-to-do.

#### CONCLUSION

The foregoing discussion is intentionally confined to the broader aspects of the income tax, and therefore leaves untouched many important problems which will confront the framers of appropriate law for any given locality. The scope of the law,—whether in any given case the tax should apply to all income received by residents of the state from whatever source derived or shall be confined to income produced within the state whether received by residents or non-residents; the proper exemption and rates to apply, and whether the latter should be graduated or proportional; whether a distinction should be drawn between earned and unearned income and how to treat profits derived from the sale of capital assets; what, if any, allowance should be made for the exhaustion of mines and other wasting assets, and the distribution of the tax among the various taxing districts of the state, are questions for detailed and intensive study in view of the conditions prevailing in the state rather than for general discussion at a gathering of this kind.

The important matter here is that the problem be approached in a fair spirit and with open mind. Income taxes like all other burdens imposed under state laws are subject to the equal rights clause of the federal constitution, which frowns upon favoritism and discrimination. But they are subject to a higher law, the law of justice and equality among the citizens and taxpayers of the state. In this day of rapid change and seething unrest, there is special necessity for both courage and moderation, courage to change an old system when found inadequate or unjust and moderation to confine the remedy within its proper limits. There is no room for favoritism, resentment or class prejudice. To frame a law of this character and in this spirit is a task worthy of your wisest economists and statesmen. May their labors be guided by the conviction that in the field of taxation as elsewhere righteousness exalteth a state as well as a nation.

TABLE 7

TABLE SHOWING INCOME TAX LEVY, CORPORATION, INDIVIDUAL, OFFSETS, CASH COLLECTIONS, AND DELINQUENTS FOR THE YEARS 1912 TO 1920 INCLUSIVE

	Total Levy	Corporation	Individual	Offsets	Cash Collections	Delinquent
Income of 1911 assessed in 1912	\$3,482,883.25	\$2,921,458.42	\$561,424.83	\$1,609,711.02	\$1,631,413.38	\$241,758.85

## CHAPTER V

---

### THE TAXATION OF BANKS

HARRY JEROME

*Assessor of Incomes, Dane County, and Assistant Professor of Economics, University of Wisconsin.*

For many years there has been evident in banking circles a desire to modify the present system of taxing banks, not only in Wisconsin, but in most of the other states of the Union. The belief that the taxation of banks is unsatisfactory has been frequently voiced in addresses and articles within the last few years. Usually the protest is directed against the great diversity in the various state taxing laws, or, more particularly, against the lack of uniformity in the application of the statutes in the various assessment districts of a state. "In bank taxation," says Milton W. Harrison, secretary of the Savings Bank Section, American Bankers Association, "the complaints of bankers have not been so much with reference to the law of the state as to the method of assessment or the discretion or indiscretion of local assessors."<sup>1</sup> A similar protest has been expressed by a representative of the Wisconsin Bankers Association, in the statement that there are "about as many methods of assessing banks as there are assessors in the State."

With this criticism in mind, and with the general thought that taxation laws work best when most thoroughly understood by all concerned, the following paragraphs are devoted chiefly to a description of the present method of assessing banks in Wisconsin, both for the information of the taxpaying public and as an aid to the local assessors and supervisors of assessment in the processes of assessment and equalization.

Inasmuch as the following analysis of the existing law and practice indicates some ground for the complaint that there are features of our system of taxing banks in need of improvement, a few suggestions are ventured as to how this improvement might be accomplished within the limits of practicable amendment to the existing law and by means of administrative machinery now in existence.

---

<sup>1</sup> National Tax Association, Proceedings, 1919, p. 35.

## THE LAW OF BANK TAXATION

The character of bank taxation in the United States has been largely determined by the provisions of Section 5219 of the federal statutes, which prescribes the way in which national banks may be taxed by the states. Their real estate may be taxed as other real estate is taxed, but no other taxes may be levied by the states on national banks, except that their shares may be taxed as personal property to the individual shareholders, on the same basis that other moneyed capital is taxed. As state banks are close competitors of national banks, the dictates of expediency and justice have brought it to pass that the taxation of state banks usually accords with the limitations imposed upon the taxation of national banks.

Within these limitations, however, there is still room for considerable variation in the methods of bank taxation established by the statutes, not to mention the still greater diversity which appears in actual practice. A brief survey of a few typical methods will suffice to suggest the extent of the diversity possible even under existing limitations, and possibly afford some clue to the lines which remedial legislation might follow.

The simplest of all the methods is the placing of a fixed rate on the book value of all banks in the state. Thus, in New York banks are taxed one per cent on their capital, surplus, and undivided profits. Or, as provided in the Connecticut law, the rate may be a fixed percentage of the market, instead of the book, value of the stock. Again, the value of the bank stock may be determined, either at market value or at book value, and then a certain percentage of this value assessed for taxation purposes. This is the classified property tax scheme, as found in Minnesota, where banks are taxed on forty per cent of their book value. In the majority of the states, however, the law requires the assessment of bank stock at full market value, or at book value, at the rate applied to other property. The assessment is usually made by local assessors, but may be made by a central authority, as the state tax commissioner or commission. Further variation may be introduced into any of these methods by providing for certain deductions. The most common provision of this type is for the deduction from the total value of the stock of the assessment on the real estate used as a banking house.

The Wisconsin system is local assessment and taxation at the local rate, on the market value of the bank shares less the assessment on the banking house and site if owned by the bank. The Wisconsin statutes provide that personal property shall be assessed at its "true cash value," and bank stock, which is assessed as personal property, falls under this rule. True cash value is taken to mean the ordinary market value; that is, the amount which an investor would ordinarily be willing to pay for the stock at private sale. Neither the artificially high value which a buyer anxious to get control of a bank might pay

for a fraction of the stock, nor the low price of a forced sale represents "true cash value."

There is a frequent misunderstanding to the effect that banks in Wisconsin are assessable at their book value. It may be true that book value is often taken as a measure of market value, but the law clearly means that bank stock shall be assessed at its market value to the stockholders, which is not necessarily the same as the value of the net assets of the bank or the investment in the bank as measured by book value. Occasionally where a bank is in bad repute or other unusual conditions exist, the market value may be less than the book value, though ordinarily book value may be considered the minimum. Often the market value will be larger than the investment or book value, including an element of excess over capital, surplus and undivided profits, partaking of the nature of a good will value.

The rule in Wisconsin is, that from the market value of the bank stock the assessment on the banking house, if it is owned by the bank, is to be deducted in determining the amount to be assessed to the stockholders as personal property. The assessment on the banking house includes the assessment on the building occupied by the bank and also the assessment on the site thereof. Though the bank may occupy only a part of a building, it is ordinarily permissible to deduct the assessment on the entire building. In some instances in assessing banks, this provision of the law has been interpreted to mean that where a bank occupied, for example, only half of the ground floor of a building, only half of the total assessment on the banking building should be deducted, but the Tax Commission is inclined to hold that "when the stock is properly valued the assessment of the entire building in which the bank carries on its business may be deducted therefrom, even though part of such building is used for other than banking purposes." Such complete deduction, however, is upon the condition that the building be essentially a single indivisible structure, not merely two buildings with a nominal structural connection. Assessments on real estate owned by the bank other than the banking house and site may not be deducted.

#### HOW TO ASSESS BANKS IN COMPLIANCE WITH THE LAW

To assess banks in compliance with the law, one should first determine the full market value of the banking house and site. This is not necessarily the value at which the property is carried on the books of the bank, as it is a common practice for banks to "write down" the value of their banking houses. This is looked upon as a good banking practice, but may be a little misleading to the assessor.

The assessor should next determine the *market* value of the shares of the bank, and, if the bank owns its place of business, deduct the assessment on the banking house and site from the total market value

---

\* Wisconsin Tax Commission, pamphlet, "Assessment and Collection of Taxes," 1920, p. 78.

of the bank stock. The remainder should be divided by the number of shares, and the assessment per share thus obtained multiplied by the number of shares held by each stockholder and entered on the assessment roll against the names of the respective stockholders, on the special pages in the roll reserved for bank stock. Assuming a bank with a capital of \$10,000 divided into 100 shares of \$100 each, the process may be illustrated thus:

- |   |          |
|---|----------|
| 1. Assume that the market value of the stock is determined by the assessor from all available evidence to be.....   | \$15,000 |
| 2. Deduct the assessment for the current year on the banking house and site, if owned by the bank, for example..... | 2,000    |
| 3. Record as the net portion of the value of the stock subject to taxation as bank stock.....                       | \$13,000 |
| 4. Compute the taxable value per share (\$13,000 divided by number of shares or 100).....                           | \$130    |

The chief task in this process is the determination of the market value. The easy-going assessor will frequently merely assess a bank at its book value without further inquiry into its market value, or, if he is inclined to underassess, at the amount of the capital only. The careful assessor who tries to obey the law will take other factors into consideration. Though book value is the first factor to consider in determining market value since it will ordinarily not be less than book value nor markedly greater, yet it is also true that the stock of two banks with the same book value may have a different market value. The principle that the investment in a corporation is not the necessary equivalent of the market value of the stock of a corporation has been unequivocally stated by the courts<sup>3</sup> and is, for banks, frequently substantiated by the sale of shares at prices other than book value.

The assessor should give some weight to dividends paid by the bank, or, better yet, to the total earnings during a period of years; to the ratio of deposits to investment; to market quotations or unquoted sales; to the extent to which there are concealed assets not shown in the book value; and to any other facts that might influence the prospective purchaser of the stock. Market quotations are not available except for banks in the larger cities.<sup>4</sup> The values indicated by the occasional sales which occur in the smaller banks should be taken into consideration but only after being closely scrutinized. The price paid for one or two shares is not always a good single criterion of the value of the stock as a whole, particularly where it is bought for the purpose of getting control of the bank, or for other reasons aside from those actuating the ordinary investor. The fact of such sales will appear from the changes in the lists of stockholders and in the number of shares owned by each from year to year. Sometimes

<sup>3</sup> See the *Union Trust Co. v. Michael Coleman*, 126 N. Y., 433; also the *Home Savings Bank v. Des Moines*, 205 U. S., 503.

<sup>4</sup> The writer has some doubts as to whether the quoted market values of the large city banks are always accurate indications of the current market value of the bank stock.

the sale prices will be shown in the income reports and will aid the assessor of incomes in making equalization recommendations but such information can be used only within the limits imposed by the secrecy provision of the income tax law, and in any event should be checked by further inquiry.

Those charged with the determination of the value of bank stock will frequently find that persons familiar with local investment conditions will be glad to give them information concerning the market value of bank stocks if assured that the information will be held confidential.

#### HOW TO ESTIMATE THE EARNINGS OF A BANK

The ordinary published statements do not directly show the earnings, but where the earnings of a bank cannot be readily ascertained by direct inquiry from the bank officials, they can be estimated by adding together the following amounts:—

- (1) The dividends paid during the period under consideration.
- (2) The increase in the book value during this period.
- (3) The extent to which building or fixtures have been written down in excess of actual depreciation.

Some consideration should also be given to the amount of salaries paid stockholding officials of the bank. If these are unusually large, they virtually represent in part earnings on the stock. There are, also, other ways of concealing assets in the form of side accounts belonging to stockholders. The dividends paid can be ascertained by inquiry of the officers of the bank or its stockholders; or by the assessors of incomes from the income reports of the stockholders by comparing the dividends reported with the shares owned by them as shown by the lists of stockholders furnished each year to the assessor and recorded in the assessment and tax rolls. The increase in book value can be ascertained by comparing the total of capital, surplus and undivided profits at the end of the period under consideration with that at the beginning. The writing down of the value of the building will appear in the same way.

There is a tendency for banks to establish a regular dividend rate which is adhered to even when profits would permit a larger dividend, the excess being passed to surplus. Six, eight, or ten per cent dividends are common. Such a standardized dividend rate has probably more influence on market value than its mathematical relation to the total of actual earnings would justify. Of two banks which earn twelve per cent regularly, the stock of the one which pays eight per cent would probably sell more readily than that of the bank which pays only six per cent.

With sufficient preliminary investigation, it would perhaps be possible to develop a satisfactory mathematical rule which could be applied to the determination of the value of bank stock in such a way

as to give approximately the correct weight to the various factors such as book value, dividends, total earnings, sales, and the volume of the business as indicated by deposits; but with the limited information now at hand it would seem wiser to set forth the facts to be taken into consideration and leave it to the judgment and knowledge of those charged with the duty of assessing banks to give the proper weight to the various influences which go to determine the value of bank stock.\*

#### HOW BANKS ARE ACTUALLY ASSESSED IN WISCONSIN

It is a familiar fact that actual practice may vary far from the rules set down in the statute books. Thus it is frequently asserted, particularly by the banks, that because of the fact that the banking business is subject to close examination and publicity, and that consequently the investment of the bank is readily ascertainable, banks as a rule are overassessed as compared with other kinds of property subject to the general property tax. It is also suggested that the reluctance of bankers to antagonize public opinion by protesting against high assessments makes them easy prey to disproportionate assessments.

To test the accuracy of these suggestions an examination has been made of the 1919 assessment of a large number of Wisconsin banks, all chosen, to make easier the identification of assessments on individual banks, from districts having but one bank. Comparisons were made between the gross assessment (assessment on building plus assessment on stock) of 305 banks and the book values as shown by statement of May 12, 1919. A marked tendency to assess at less than book value appears. Sixty-three banks were assessed at less than capital stock; 28 at the amount of capital stock; 93 at something more than capital but less than capital plus surplus, while only thirty banks were assessed at more than book value, of which twelve were located in two counties.

It is true these 305 banks are all located in districts where there is but one bank and that the assessments on banks are probably some-

---

\* As an illustration of the type of studies which, if conducted on a sufficiently comprehensive scale, would be a material aid in estimating the value of bank stocks, it may be noted that for 306 banks in Wisconsin, located in districts where there is but one bank, the arithmetic mean ratio of deposits to book value was, according to the May 12th, 1919, statements, 9.4, and the median ratio 9.1. The average deviation from the median ratio was 3.18.

These facts suggest that the typical relation between deposits and book value for a bank of the type included in this study is about nine or ten to one, and that a ratio of deposits to book value of more than about thirteen to one is to be looked upon as indicating an unusually active business as compared with the size of the bank measured by investment, and that consequently the earning capacity of the bank is probably relatively large. On the other hand a ratio of deposits to book value of less than about six to one would seem to indicate subnormal conditions. These, of course, are tentative conclusions, merely set forth as illustrative of standards which might be established by more thorough examination of the facts concerning banks. Perhaps a comparison of book value and loans and discounts would be more significant.

what higher in the larger districts. The book value of all banks in the state on May 12th, 1919, was \$76,726,749. Bank buildings were assessed that year at \$12,063,642, and bank stock net at \$58,991,592, making a total assessment on the banks of \$71,055,234, or 92.6 per cent of book value. In only eleven of the seventy-one counties does the aggregate of the assessments against bank stock and bank buildings equal the aggregate book value of the banks. Clearly, unless we make the highly improbable assumption that bank stock is on the average worth less than the investment which it represents, we must reach the conclusion that bank stock is, as a rule, assessed in Wisconsin below its true value.

The complaint of the banks, however, is not so much that they are assessed more than the law stipulates, but that the methods of determining bank assessments are irregular and uncertain and that other property is underassessed to a greater extent than bank stock. It is not an easy matter to determine the exact merit in this criticism. After deducting assessment on buildings, the 1919 local assessment on bank stock was \$58,991,592, or 82.9 per cent of the estimated value of bank stock used in the state equalization, while the local assessment on all property was 86.3 per cent of the state equalization value, which would indicate that if the standards used in the state equalization were substantially correct bank stock as a whole was underassessed somewhat more than other personal property. But too much significance should not be attached to this comparison, as it may be that the standards adopted were too high for banks or too low for other personal property. In any event, the use of the state-wide aggregate obscures the wide range of variation between bank stock and other property which appears in the assessments of particular districts. From the point of view of equitable distribution of the tax burden, the essential question is, how are banks assessed as compared with other property in the same district. The following table will illustrate the problem. From the list of 305 banks examined, one bank with a capital of \$10,000 was picked at random from each of ten counties. The table shows the book value per share, the combined assessment per share on stock and banking house, the ratio of the assessment to the book value, and the ratio of the assessment of real estate in the same district to the so-called true value based on a five-year sales average.

TABLE NO. 1

Bank No.	Book value per share	1919 Assessment per share	Ratio of assessment to book value	Ratio of real estate assess- ment to true value
1.....	162	100	61.7	77.0
2.....	235	130	55.3	75.1
3.....	223	115	51.6	91.9
4.....	120	94	78.3	77.1
5.....	198	117	59.1	78.0
6.....	146	100	68.5	70.0
7.....	179	145	81.0	122.1
8.....	140	105	75.0	81.6
9.....	164	159	96.9	87.7
10.....	134	46	34.3	72.2

It will be noted that each of these banks is assessed at less than its book value, in a proportion ranging from 34.3 per cent to 96.9 per cent, but that real estate is also assessed below the "true value" in each district but one. It is needless to say that the meager evidence afforded by these ten banks does not justify conclusions that banks as a whole are more or less underassessed than other property, but it does illustrate the fact that relative rather than absolute assessments are most significant. Though the stock of bank number 6 is assessed at only 68.5 per cent of book value, this assessment is apparently on about a parity with the assessment of real estate, and the same relation holds true in a number of instances as shown in the table. In the case of bank number 3, on the other hand, the stock of the bank seems to be markedly underassessed while the assessment on real estate in the same district exceeds 90 per cent of the true value based on sales.

A somewhat broader basis for judging the relative assessments of banks and other property is found in the following comparisons: the local net assessments of bank stock in Wisconsin aggregated, in 1919, 91.2 per cent of the book value of the banks less assessments on the banking buildings, whereas the local assessments on all personal property aggregated only 88.6 per cent of its true value using as the standard of true value the estimates made by the assessors of incomes. On this basis it would appear that the banks were relatively overassessed. On the other hand, if we use the same standards for true value, but compare the assessments by counties instead of for the state as a whole, we find that in 37 counties, of a total of 71 in the state, banks were underassessed more than all personal property combined. As compared with real estate the banks appear to have been relatively overassessed. For the entire state the local assessment of real estate aggregated only 87.3 per cent of its true value based on the

five-year sales average, and in all but 21 counties of the 71 the banks were assessed nearer the book value than real estate was to the five-year average. In using the five-year sales average for real estate and book value for the banks, the full market value of both kinds of property is probably underestimated by something like ten per cent, but this standard offers the most readily available basis of comparison. The variances between the districts become more apparent upon examination of the following table comparing the assessment of bank stock and the assessment of real estate for the ten districts where the differences between the assessment of banks and the assessment of real estate are greatest. In this table the ratio of bank assessment means the percentage ratio of the assessment of bank stock, after deduction of the assessment on the building, to the book value of the bank less the building assessments. The ratio for the real estate represents the percentage relation between the local assessment and the five-year sales average.

TABLE 2

A comparison of the ratios of 1919 assessments of banks and real estate to true value based on book value and the five year sales average, in 10 selected counties.  
Per cent of true value

County	Banks (1)	Real Estate (2)	Difference (1) less (2)
La Crosse.....	124.8	89.7	+ 35.1
Outagamie.....	117.8	84.2	+ 33.6
Dunn.....	89.0	62.3	+ 26.7
Eau Claire.....	92.5	67.2	+ 25.3
Juneau.....	100.3	77.9	+ 22.4
Forest.....	78.9	57.6	+ 21.3
Marinette.....	92.4	74.1	+ 18.3
Wood.....	83.1	95.1	— 12.0
Washburn.....	62.3	77.5	— 15.2
Ozaukee.....	68.1	83.9	— 15.8
Adams.....	56.5	72.8	— 16.3
Lafayette.....	65.6	100.3	— 34.7

What conclusions can be drawn from the facts presented above? In the first place, there is clearly a wide variance in the assessment of stock of banks representing substantially the same investment and having presumably somewhat similar market value. For example, bank No. 1 and bank No. 9 in table 1 have about the same book value per share, but one is assessed at 100 and the other at 159. In the second place, the frequency with which banks are assessed at capital or capital plus the assessment on the buildings, indicates, either a failure on the part of the local assessors to understand that surplus

and undivided profits affect the market value of bank stocks, or a deliberate intention to assess below market value. Lastly, while the fact of underassessment is partially neutralized, and to some extent justified, by the underassessment of other property, the degree of underassessment of bank stock and other property is seldom the same. In some districts, the banks are bearing more than their share of the burden; in other districts, less than their share.

But to point out defects in our tax laws or administration is a fruitless undertaking unless it tends to the removal of those defects. How can we improve the method of taxing banks in Wisconsin? Must we wait for a sweeping change in the whole system of property assessment, or can a plan be devised which will accomplish the purpose without involving changes for which conditions are not yet ripe?

#### PROGRAM FOR IMPROVEMENT

Some improvement in the assessment of bank stock may possibly come without any change in the existing law, but there seems small hope that substantial improvement can be attained without such a change. Granting this, what change should be made? For the present it is impracticable to attempt to bring banks under the state income tax law. National and state banks are active competitors and must for that reason be treated alike, and until the federal banking law is changed the state income tax cannot be applied to national banks.

Nor is it feasible to attempt to tax bank stock in Wisconsin under a classified property tax. Whether classification is constitutional or not the Wisconsin tradition is against classification. There is no evident body of public opinion favorable to the classification idea. An income tax, which to some extent accomplishes the same objects as classification, is thoroughly established, and the practice of either exempting property entirely or endeavoring to assess it on the same basis as all other property is so well established that the burden of proof is thrown upon any proposal to adopt the somewhat hazardous principle of classification.

It would be possible to substitute a county assessor for the present local assessors and such a change has much to recommend it, but it is not the best device for securing satisfactory assessment of banks. The assessment of bank stock lends itself to even greater centralization of administration than is involved in the county assessor scheme, and it is not desirable to postpone an improvement in the assessment of bank stock until such time as public opinion can be educated to the advantage of the relatively sweeping changes involved in the substitution of a county assessor for the local assessors. The conditions are exceptionally favorable to assessment of bank stock by some central agency, such as the state tax commission. Where accurate assessment rests largely on intimate knowledge of local conditions, there may be some justification for the retention of the local assessor, but where it rests on the interpretation of corporation statements, such

as bank statements, the only satisfactory method is centralized assessment. There are not so many banks as to make it impossible to give adequate attention to each. The valuation of railways is now made by a centralized authority in Wisconsin and in many other states, and the valuation of bank stocks would be a less complicated task on the whole than the valuation of a railroad. Complete reports could be required showing practically all facts essential to accurate assessment, and a member of the staff of the commission could make himself much more familiar with the technique of bank statements than it is possible for the local or county assessor to do. We should not, of course, overlook the value of intimate knowledge of local conditions. But there is no essential reason why advantage could not be taken of such knowledge by obtaining information from local assessors without relying on them for final determination of the value of the bank stock. With the aid of supplementary information from the local assessors and assessors of incomes, it would be possible to ascertain the true values of the bank stock more closely than it can be calculated by any other agency.

However, the very thoroughness of the available information, making readily possible the assessment of bank stock at full cash value by the tax commission, might serve to intensify existing inequalities between the taxation of bank stock and other property. If banks are submitted to state assessment, and the assessment of other property remains at less than the full cash value, equity requires that means be devised to adjust the assessment of banks to the degree of local underassessment of other property. This may be done, either by taxing all banks at a flat rate adjusted to allow for the extent to which other property is underassessed in the state as a whole, or by adjustment to the assessment practice in each local district, and taxation at the local rate on other property.

For example, all banks might be taxed at the average rate on all property in the state, obtained by dividing the sum total of taxes by the true value of all taxable property. This method is applied in Wisconsin to railroads and, in view of the state-wide nature of the railroad business, appears to be the logical method of determining the rate. The average state rate is not, however, well adapted to banks, for the reason that the great majority of banks in Wisconsin are essentially local institutions and should be taxed at rates varying with local conditions rather than at an average state rate. The local nature of banks is recognized in the provision that bank stock shall be taxed where the bank is located, and there is a sound basis in fact for looking upon banks as local institutions. Their stockholders are largely local business or professional men or local property owners; they serve the local community and compete with other banks in the same immediate district. Hence in questioning whether the tax burden of a given bank is equitably proportioned, it is more to the point to compare its taxes with those of other businesses or other property, and particularly with the taxes of other banking institutions, in

the same assessment district, than to compare its taxes with those of banks in some other community. The burden caused by public expenditure varies considerably in the various communities, and a method which will assess and tax a bank equitably as compared with other taxpayers in the same assessment district is more to be desired than a system which will assess all banks on a fixed basis which disregards the local conditions. This is one weakness of the frequently commended New York system of imposing a flat rate of one per cent on the book value of all banks. Banks should be taxed at a local rate, varying with local tax burdens, rather than at a fixed rate or at the average state rate.

The argument that the assessment of banks should vary with local assessment of other property does not necessarily carry with it the conclusion that the income from the ownership of bank stock should be taxed at the same rate as income from other corporation stock. Even if a personal property tax on the value of bank stock represents a higher proportion of the income from the stock than is taken by the income tax from the owners of other corporation stock, the bank tax is not necessarily to be condemned as proportionally excessive. It must be remembered that there is no state income tax applying to the earnings of banks, and that a bank stands in a somewhat different relation to the public than an ordinary corporation. Both creditors and stockholders are hedged about with safeguards provided by the state, and such income as is earned partakes of a somewhat greater degree of permanency and less of the risk element than income from ordinary corporation stock. The double liability of stockholders, however, offsets this advantage to some extent.

But whether or not the market value of bank stock is considered the correct base upon which to levy bank taxes, the argument still holds that if the banks are to be assessed by a central authority, the assessment should be adjusted to the fact of local underassessment, wherever it exists, and then the local rate applied to the adjusted value. This method is now applied under the provisions of Chapter 645, Laws of 1917, to interdistrict public utilities, such as a gas plant serving patrons in a city and the adjoining rural territory. The tax commission determines the true value for the entire utility, and apportions this to the several districts in which it operates, and then in each district makes an assessment which bears the same ratio to the true value that the assessment of real estate in the district bears to its true value. If the true value of the utility assigned to a given city is \$100,000, and the real property in that city is assessed at ninety per cent of its true value, then the utility is assessed at \$90,000, at the local rate of taxation.

This method could readily be applied to banks, as under the regulation to which banks are subjected reports can be obtained from them which would give a quite accurate index of the condition and earnings of the bank. The present method is satisfactory to no one. The local assessor finds it difficult to assess bank stock satisfactorily, partly

because the banker is often a powerful local influence, but more often because the assessor does not understand how to interpret bank statements; the supervisor of assessments often finds himself in the dilemma of recommending to the local assessor a value which he knows violates the letter of the law or an assessment at full value which will be disproportionate in view of the probability that the assessor will underassess other property. The bankers themselves condemn the present system as arbitrary and unfair in its operation. The only parties who stand to lose by a change are those banks which are now escaping with an underassessment and other taxpayers in those districts which are now taxing the banks relatively too high. Of course, the change proposed, if the work is to be done in the thorough way necessary to accomplish the desired improvement in the taxation of banks, would throw additional burden on the staff of the tax commission, particularly in the first year when an initial investigation of the status of individual banks and of the factors influencing the value of bank stock was being made. However, under the present system the statement of each bank is digested in the process of determining values for the purposes of the state and county equalizations, hence, in the long run, it does not seem probable that the total amount of effort involved in the assessment of banks would be appreciably increased, and the process of county equalization would be simplified, as the true values established by the Tax Commission could appropriately be used for the county equalization, just as the true values found by the Commission for inter-district public utilities are now the usual basis for determining the true value of these properties in the county equalizations.

It would be somewhat of an exaggeration to say that there is an imperative need for change in the method of taxing banks, but most progress comes by degrees, and it does appear that the change suggested would be a step toward a more logical and more equitable method of taxing banks in Wisconsin.

## CHAPTER VI

### ASSESSMENT OF PUBLIC SERVICE CORPORATIONS

Properties of public service corporations valued at approximately a half billion dollars are under existing laws assessed annually by the tax commission. Measured in terms of valuation these properties represent 98% of all public service corporations in the state, the remaining 2% being assessed by local assessors.

The table below shows the valuations and taxes for the year 1920 of each class separately.

TABLE 15

## ASSESSMENT OF PUBLIC SERVICE CORPORATIONS FOR THE YEAR 1920

	Assessment	Taxes at .01895318
Railroads .....	\$380,734,000	\$6,837,056.47
Street Railways .....	71,360,000	1,352,498.98
Conservation Companies .....	350,000	6,633.61
Telegraph Companies .....	4,325,000	81,972.50
Express Companies .....	500,000	9,476.59
Sleeping Car Companies.....	1,775,000	33,641.89
Freight Line Companies.....	1,384,000	26,231.22
Inter-district Electric, Gas and Water Companies (Entered on local rolls).....	34,411,500	652,172.94*
	\$474,839,500	\$8,999,684.15

\*Note: This figure is an estimate based on the rate above. These companies are in fact subject to local rates of the districts through which the properties extend which had not been reported at the time this report goes to press.

Notwithstanding the fact that the present system of taxation of public service corporations has long been in operation it is evident from the nature of inquiries made that there is still considerable misapprehension as to what is the basis of valuation for assessment. This condition prevails among public officials, the legal profession, and corporations themselves, as well as the general public. For this reason a brief explanation and discussion of the system and the activities of this department of the work is herewith presented.

All of these properties are assessed under what is known as the *ad valorem* system of taxation. While necessarily there are special provisions in the law applicable particularly to each of the classes men-

tioned in the above table, the general scheme of assessment is substantially the same for all classes.

The basis of the assessment under the ad valorem method, as the term indicates, is value. No set formula is given for ascertaining this valuation,—on the contrary the method to be pursued is left to the judgment of the assessing officers.

The following are the sources of information from which statistics are obtained upon which valuation of these companies is based:

1. Annual reports by the companies
    - (a) To the tax commission
    - (b) To the railroad commission
    - (c) To the Interstate Commerce Commission
    - (d) To stockholders
  2. Appraisals of physical property
    - (a) By the state engineer
    - (b) By the Interstate Commerce Commission
  3. Financial publications
  4. Briefs, oral arguments, correspondence, and special reports made by the companies before or after hearings.
- From the annual reports made to the tax commission the following important data as to each company are secured:
1. Number of shares of capital stock
  2. Par value of such stock, showing the amount authorized, amount issued, and the dividends paid thereon.
  3. Market value of the shares.
  4. The funded debt, including all series of bonds, debentures, and securities, with date of issue and maturity, interest paid, etc.
  5. Schedules of property investments, length of lines, etc.
  6. Earnings, gross and net, both within and without the state of Wisconsin, and other details.

The reports made to the railroad commission necessarily contain much more detail than those to the tax commission. Use is made of such reports in checking the data returned to the tax commission, and in obtaining more detailed information which is sometimes required in particular cases. They do not, however, contain all of the information that is required for tax purposes.

All railroad companies and all other corporations engaged in interstate business report to the Interstate Commerce Commission. As that commission prescribes the system of accounts for railroads and the larger interstate corporations, and the reports are public records they furnish a valuable source of information and comparison. Copies or portions thereof are required to be made for tax purposes and in general the system of reporting used by that body has been adopted in making up the forms for report to the tax commission.

When the ad valorem system of taxation was adopted in 1903 it was deemed advisable to have a detailed inventory and appraisal made of the properties of all railroads. Expert engineers were placed in

charge of this work, and with the co-operation of the companies the task was completed and report filed in 1905. (See Appendix A, Tax Commission Report 1907.) Later when the railroad commission was organized appraisals made by the tax commission engineer were available for that commission and the engineering department was by agreement supported jointly by the two commissions.

Annually thereafter appraisals were submitted not only of the railroads but also of practically all other public service corporations. While this appraisal work has to a large extent been discontinued for taxation purposes the material heretofore gathered is still of great value and is used together with additions since last appraisal in determining the present cost of reproduction of the physical property. So far as railroads are concerned an inventory and appraisal is now in progress by the Interstate Commerce Commission and reports of Wisconsin companies are being received from time to time.

The financial publications principally used in connection with these assessments are: "The Wall Street Journal," a daily paper published in New York, and "The Commercial and Financial Chronicle," a weekly periodical. These publications give reports of all sales of stocks and bonds of the larger interstate railroad companies and other corporations. Use is also made of Moody's Investment Service and Poor's Manuals which contain special analyses of capitalization, investments, earnings (past and prospective) of the different properties. These publications also furnish material for continuous study of the general financial situation as affecting values of properties under consideration.

#### FRANCHISE AND GOING VALUE

Undoubtedly among the reasons for placing public service corporations in a special class for valuation and assessment is that they enjoy special privileges among which are right of eminent domain and in most cases virtual monopoly, these being inherent in the nature of the business. These rights and privileges may and often are of considerable value over and above the investment in property. The statute specifically requires that franchises be included. Furthermore, the system set forth in the statute evidently contemplates that these companies shall be valued as going concerns and not as so many parcels of real estate and items of equipment. In fact a railroad, electric or gas plant is something more than mere land, rails, cars, wires and machinery. It is a live, going business guided by brains and having rights and privileges which gave it an organic unity. The theory of our ad valorem law as applied by the tax commission was upheld by our supreme court in an exhaustive opinion involving the first valuation for assessment purposes of railroads. (*Chicago & Northwestern Railroad v. State*, 128 Wis. 553.)

One of the things which seems to have been overlooked by a considerable portion of the public is that laws and regulations provided for valuations for rate regulation do not and cannot apply as to valua-

tions for purpose of taxation. Space will not be here taken for discussion of the reasons for the difference in such valuations, but those interested will find the matter discussed in the 1916 report of the commission, pages 99 to 101.

The meaning of the word "value" as taken for tax purposes is market or exchange value, i. e., the meaning ordinarily put on the word. The problem is to determine this value. Now, in putting a price on a parcel of land, a residence or a business block the obvious and customary method is to ascertain at what figure similar properties have sold. Such value in the long run is based on the opinion of the public or more particularly persons who stake their money back of their judgment. There is no better guide than this to market value. It is the basis of the method employed by the commission in fixing value of real estate in the state equalization. Unfortunately railroads and other public utilities unlike other property are rarely sold as units. However, shares as represented by stocks and bonds of some of the large corporations are constantly being transferred and these data afford one means of determining market value of the entire property. Now, this method would be sufficient and adequate without other data were it not for the fact that as only a portion of the stocks and bonds of a given company are sold in any one year, it is questionable whether prevailing prices would hold in case a controlling interest were to be transferred. Besides this the stocks and bonds of a railroad represent not only all property used in the transportation business but also all investments made in securities of other corporations: other railroads, land, mines, timber, government bonds and many others, some of which in order to avoid duplication must be deducted. In addition to this, as is well known there is more or less manipulation of the stock market. For these reasons additional methods must be employed for comparison and verification. The most important of these methods is what is known as "capitalization of net earnings."

This method is based on the same theory that obtains in valuing annuities, i. e., that the capital or property value of a given annual income may be computed providing the length of time such annuity is to run is known or can be approximated. As a matter of fact, this method is that used by bankers, brokers, and investors generally in estimating value of corporate securities. Of course, other things are taken into account by them particularly those affecting the safety and stability of the investment. Likewise, these matters must be considered in valuing the properties which these securities represent.

Now, earnings of public utilities, unlike annuities, are not uniform. They fluctuate from year to year depending on a variety of circumstances: management, markets, labor, crops, and the general trend of business. Furthermore, it must be kept in mind that it is not past earnings which really give value to these properties but the prospect of future earnings, and this means earnings over a period of years.

The best method of measuring future earning capacity is, however, by past performance. The period taken has usually been five years. Averages of net earnings are computed and capitalized at various rates.

The rates of capitalization employed being based upon the rates demanded by the investing public necessarily cannot be uniform as to all classes of public utilities, nor even as to companies of the same character. Regularity, uniformity and stability, as well as amount of earnings, have an important bearing on the rate expected by investors. As a general rule, the larger the company the less fluctuation there is in earnings. For this reason larger railroads have been put in a special class and the lowest rates have been applied to them. These rates have ranged from 6% to 6½%. The smaller companies have been capitalized from 7% to 8% after giving careful scrutiny of the income returns for a number of years back. In assessing street railways and light, heat and power companies the rates have ranged from 6½% in the case of large and prosperous companies to 8%, depending on the hazard of the investment and the stability of the enterprise. In a few cases involving small plants even higher rates were used, it being apparent that the risks were large and future prospects unattractive.

In using this method it must be borne in mind that, notwithstanding the rules of accounting prescribed by regulating bodies, there are marked variations in methods of financing and management, all of which affect net earnings as reported. For example, some companies pursue a liberal policy as to maintenance and depreciation, while others in order to make the best possible showing to stockholders and prospective investors in securities have exactly the opposite policy—what is sometimes called “milking the property.”

There are considerations even more important. Conditions sometimes undergo radical change in a short time, so that average earnings of past years cannot safely be relied on as indicating future earning power. Thus the opening of the world war; our entry therein; government operation and control of transportation and markets so unsettled previous conditions and values that the earnings of prior years could not be accepted as an accurate criterion to gauge the future.

#### RAILROADS

In determining valuation for assessment of railroads two principal methods are used. One is the stock and bond method and the other the capitalization of net earnings method referred to above. Only the securities of the larger interstate roads are reported on the stock markets so that reliance must be had on capitalization method for most companies. In cases where there are no net earnings or where the business is operated at a loss the valuation must be based on the investment or cost of reproduction, consideration being also given to any factors which may affect future prospects of the property. Some logging railroads are worth little more than “scrap” or “junk” value as no traffic can be expected after the adjacent timber is exhausted.

As will be seen from examination of the following table the earnings of the larger interstate railroads suffered a radical decline in the years 1918 and 1919 during government operation.

TABLE 16

SYSTEM NET EARNINGS OF THE EIGHT LARGE INTERSTATE RAILROADS  
(Taxes Deducted)

	5 yrs. Average Net Earnings 1913-1917 Inclusive	2 yrs. Average Net Earnings 1918 and 1919
Chicago & Northwestern Ry. Co.....	\$22,423,200	\$13,244,288
Chicago, Milwaukee & St. Paul Ry. Co.....	26,945,333	4,484,709
Chicago, Burlington & Quincy R. R. Co.....	31,684,595	24,538,543
Chicago, St. Paul, Minneapolis & Omaha Ry. Co....	4,916,162	2,876,496
Great Northern Ry. Co.....	28,201,574	10,882,904
Illinois Central R. R. Co.....	13,437,457	7,412,982
Minneapolis, St. Paul & S. S. M. Ry. Co.....	11,597,356	4,949,566
Northern Pacific Ry. Co.....	26,185,370	19,169,548

This reduction in earnings was reflected in market quotations of securities, (see page 6) and necessarily could not be overlooked in determining valuations for assessment. As will be noted from the tables following there was a reduction of \$24,605,000 in the total valuation for 1919, and a further reduction of \$5,326,000 in 1920. The largest decrease was in the case of Chicago, Milwaukee & St. Paul Railway which showed the greatest falling off both in earnings and stock quotations. Table 3 shows the total valuation, tax rate, and taxes of railroads in this state from the first assessment in 1904 to 1920, inclusive. It will be noted that there was an increase each year over the preceding year until 1919. The effect of the increases in freight and passenger rates will doubtless be reflected in future earnings.

In the case of interstate railroads there is no absolutely accurate way of determining the earnings and expenses in each state. Rate charges for passenger and freight are, of course, based on distance traveled. The difficulty is that track mileage as a basis of apportionment takes no account of terminal expenses which are claimed to constitute a considerable portion of the expense of transportation. The large cities with immensely valuable terminals, of course, are not given proper credit on a track mileage basis of apportionment. Repeated attempts have been made by state and federal bodies to solve this problem but as yet no solution is in sight. No specific system of apportionment has been prescribed for apportioning earnings by any state or federal regulating body. Consequently, there is a lack of uniformity in the methods of reporting as between the different companies. This being the case we have found it desirable to make independent apportionments using all available data bearing upon the matter. Valuations are made of the entire system and then appor-

tionment is made to the state, partially on earnings and partially on other data. The average percentage, Wisconsin to system, of the following data is commonly used in apportioning system valuation to the state.

Gross earnings  
 Net earnings  
 Revenue train mileage  
 Car and locomotive mileage  
 Track mileage  
     Single track  
     All track

Table 4 gives the assessment and taxes of each company for the years 1919 and 1920.

TABLE 17

ASSESSMENT AND TAXES OF RAILROADS IN WISCONSIN FROM 1904 TO 1920  
 INCLUSIVE

	Assessment	Tax Rate	Taxes
1904.....	\$218,024,900	.01144065	\$2,494,282.57

## THE AVERAGE STATE RATE

The tax rate applied to railroads is the average rate applied to general property of the state. The value of the general property of the state as fixed by the tax commission for equalization purposes, i. e., the state assessment is used as a divisor, the total taxes levied by the state, county, towns, cities, and villages for all purposes is used as a dividend, and the quotient represents the percentage which constitutes the rate. As the state assessment is on the basis of full market value this tax rate is the true average tax rate of the state. The following table shows the application of the formula in computing rates for 1919 and 1920 assessments.

TABLE 19

FORMULA USED IN COMPUTING AVERAGE RATE APPLICABLE TO RAILROADS AND OTHER PUBLIC UTILITIES FOR THE YEARS 1919 AND 1920

These Data are in Continuation of that Shown on page 54, Report 1918.

Dividend	Divisor	Quotient
Aggregate state, county and local taxes	Value of general property	Average rate
1918....\$56,254,857.21	1918....\$3,846,263,744	.01463091....1919
1919.... 77,106,385.00	1919.... 4,068,268,534	.01895318....1920

All of the tax paid by railroads goes to and is retained by the state except that derived from "docks, wharves, and grain elevators used in transferring freight or passengers between cars and vessels." In order to determine this tax the commission is required annually to make a separate valuation of each property answering this description. The basis of these separate valuations is the cost of reproduction less depreciation. As some roads are assessed at more and some at less than the cost of reproduction the terminal properties are put on the same basis by applying in each case a percentage to the cost of reproduction of each dock property. The following table shows such separate valuations and taxes and the amounts going to each city where these terminals are located.

TABLE 20

## DISTRIBUTION TAX ROLL OF TERMINAL PROPERTY FOR THE YEARS 1919 AND 1920.

Separate Valuation and Taxes on "Docks, Piers, Wharves and Grain Elevators used in transferring freight between cars and vessels."

Name of Company	City	1919		1920

## STREET RAILWAYS AND ASSOCIATED LIGHT, HEAT AND POWER COMPANIES

The method used in valuing street railways and light, heat and power companies operated in connection therewith is substantially the same as that employed in assessing railroads. One source of data, however, is not available, namely, market quotations. Only a few of these securities are listed on the markets. The valuation is based mainly on capitalization of earnings and in case of new properties on investment or cost of reproduction. The rate of taxation is the average state rate applied to railroads. Table 7 following shows the total assessments and taxes of street railways from the first assessment under the ad valorem system in 1908 to 1920, inclusive. Table 8 shows the valuation and taxes of *each company* for the years 1918, 1919, and 1920.

TABLE 21

ASSESSMENT AND TAXES OF STREET RAILWAYS AND LIGHT, HEAT AND POWER COMPANIES OPERATED IN CONNECTION THEREWITH FROM 1908 TO 1920, INCLUSIVE.

	Assessment	Taxes		Assessment	Taxes
1908.....	\$33,982,000	\$390,637.75	1915.....	\$61,973,000	\$825,934.80
1909.....	36,919,000	422,015.21	1916.....	62,688,000	825,764.60

While the taxes derived from these companies are paid into the state treasury the state retains only 15%, the remaining 85% going, 20% to the counties and 65% to the towns, cities, and villages through which the properties extend. This 85% is required to be distributed on the basis of "property located and business transacted." "Property located" has been construed to mean cost of reproduction of physical property and "business transacted" to mean gross receipts. The idea of using both "property located" and "business transacted" as a basis for distribution of the tax was to give to the country districts credit for valuable power plants and transmission lines often located in or traversing same, and to give the cities credit for the business which is largely derived from these districts. While some difficulty is experienced in getting accurate figures on which to make these distributions of the tax, on the whole, the system works satisfactorily and there is little complaint. Some errors, however, are unavoidable on account of the large number of these apportionments and as no provision is made for correction except through court procedure, the statute needs some revision to provide for the same. In order to bring this about a bill has been drawn providing that the commission may correct a material error in any year by making an adjustment in the apportionment of the subsequent year. The following tables show how street railway taxes were distributed in 1918, 1919 and 1920:

TABLE 23

DISTRIBUTION TAX ROLL OF STREET RAILWAYS AND LIGHT, HEAT AND POWER COMPANIES OPERATED IN CONNECTION FOR THE YEARS 1918, 1919 AND 1920

				Distribution to Counties, Towns, Cities and Villages

## ELECTRIC LIGHT AND POWER, GAS AND WATER COMPANIES

All interdistrict electric light and power, gas and waterworks companies not connected with street railways are assessed by the tax commission. Taxes, however, are paid into and retained by local treasuries. Valuations are based on the same sort of data as in the case of street railways and associated properties. Taxes, however, are not computed as under the law the valuation of each company must be apportioned to the different districts and is subject to local rates on general property.

The commission has previously directed attention (see report 1918, page 24) to the inconsistency of using the average state rate in the case of street railroads while the local rates are applied in the case of these interdistrict plants. Either one or the other of these methods should be changed so that the system may be uniform.

In view of the fact that these interdistrict utilities are entered on the local rolls the commission felt obliged to take cognizance of the well known fact that other property is not assessed at its full market value. Accordingly valuations of these utilities in each district have been adjusted where necessary to place same on the same basis as other property. The first assessment by the commission was made in 1918 (see page 55, Report 1918). The following table shows the true and assessed valuation of these companies for the years 1919 and 1920.

**TABLE 24**

## CONSERVATION AND REGULATION COMPANIES

Companies organized for the purpose of regulating the height, flow and conservation of water in public reservoirs are known as conservation and regulation companies. There are two such companies in the state. They are assessed by the tax commission and are subject to the average state rate. Taxes are distributed as in the case of street railways.

The following tables show the valuations and taxes of these companies.

**TABLE 25**  
CONSERVATION COMPANIES

	Assessment	Taxes
1916.....	\$290,000	\$3,830.05
1917.....	290,000	4,015.00

## TELEGRAPH, EXPRESS, SLEEPING CAR, AND FREIGHT LINE AND EQUIPMENT COMPANIES

The remaining corporations assessed under the *ad valorem* system are telegraph, express, sleeping car, and freight line and equipment companies. They have this in common: They are all closely connected with railroad operations and are largely engaged in interstate business. Most of them own no real estate within the state.

Most telegraph lines are on railroad right of ways so with the exception of office space, which is usually leased, there is no real estate. Express companies as a rule have only office equipment, horses, wagons, auto trucks, etc. Sleeping car and private car lines (freight line and

equipment companies) own cars which are hauled under contract by the railroads. There is only one sleeping car company, the Pullman Company, and since the World War, one express company, namely, the American Railway Express Company. There are 90 freight line and equipment companies assessed for the year 1920.

All of these companies are called upon to make a report to the tax commission as to earnings, property, etc., both for the system and for Wisconsin separately. The entire property and business is first valued as a unit after which an apportionment is made to Wisconsin usually on the basis of the percentage which the car mileage, wire mileage, and earnings in Wisconsin bear to the system.

The claim is constantly being made by these companies that the proper method of assessment is on the basis of physical property only. As this, of course, leaves out of consideration the valuation, if any, of their contracts with and use of the railroads, it has not been recognized. The Pullman Company is now contesting its taxes for the year 1913 and all subsequent assessments are involved. Both the validity of the statute and the propriety of its application by the commission are under attack.

The following tables show the assessments and taxes of these companies since they have come under the jurisdiction of the tax commission.

#### RECOMMENDATIONS AS TO ASSESSMENT OF RAILROADS

Some minor changes seem desirable in the law relating to the assessment of railroads.

As heretofore stated, the Interstate Commerce Commission prescribes the system of accounts for railroads and other public service companies engaged in interstate commerce. All such companies file a report with that commission on forms prescribed by it. Such reports require considerably more detail as to property, assets, earnings and operating statistics than is essential in a report for tax purposes. Nevertheless, there are occasions when a special investigation of a particular account must be made and such details become important. It is in every way desirable, therefore, in order that the statistics returned to the tax commission may be verified by comparison with statistics returned to the Interstate Commerce Commission, that the period covered by the reports shall be identical.

Prior to 1917 all reports to the Interstate Commerce Commission and to state tax and regulating commissions generally were made for the fiscal years ending on June 30. In that year the Interstate Com-

merce Commission issued an order that future reports be made to cover the calendar year ending December 31 and the state commissions, including the tax commission of this state, were obliged to make a similar change.

In 1919 the Wisconsin statute relating to reports to the tax commission was amended, the commission being given the power to designate the period to be covered by the report. Reports have since been required for the calendar year. In other respects, however, the statute was not changed. The original railroad tax law (Chapter 315, Laws of 1903) drafted on the assumption that reports would be made for the fiscal years ending June 30 still remains in force. Section 1211—8 provides that the assessment shall be commenced between September 1 and November 1 and is to be completed February 1 of the following year. The first installment (one-half) of the tax is required to be paid to the state treasurer May 1. (Section 1211—15).

Experience has demonstrated that at least two and one-half months elapse after the end of the period for which reports are required before such reports are filed by the companies. Other commissions frequently grant more time. Few reports are available until March 15, and most of them not until April 1.

Now, if the commission commences the assessment in September as the statute now prescribes, it has before it reports eight months old. Meanwhile, there have been additions to property and other changes. In view of this condition it is believed advisable that the assessment be commenced each year immediately upon receipt of the reports, i. e., March 15 to April 1.

As it requires at least a month to properly edit, tabulate and make the necessary computations relating to valuation, the preliminary assessment cannot be made much earlier than May 1. It is, therefore, believed that the statute should be further amended fixing this as the date instead of the period now prescribed.

This will necessitate a further change as to the dates for payment of the tax. The statute now prescribes, as stated above, that the tax shall be paid in two installments, one-half on May 1 and the remaining one-half on November 1. It is recommended that these dates be extended, viz.: to June 1 and December 1 of each year.

## CHAPTER VII

---

### VALUATION OF IRON MINES IN WISCONSIN

By W. O. HOTCHKISS

The legislature of 1913 directed the Geological and Natural History Survey to secure the facts needed for a valuation of the mines of the state for the purpose of assisting the Tax Commission in assessing these properties. This law was later amended so that this work is now restricted to the iron mines of the state. Since 1913, accordingly, the Geological Survey has made a valuation of these properties each spring and turned this valuation over to the Tax Commission. The iron mines of Wisconsin are in three districts, the Gogebic Range in Iron County, the Mayville district in Dodge County, and the Baraboo district in Sauk County.

Owing to the fact that mines are relatively few in number and are rarely sold, it is not possible to arrive at a close valuation of these properties on the basis of sale. A recognition of this fact and the further fact that the valuation of mines requires a considerable amount of technical knowledge of mining was the reason why the legislature called upon the Geological Survey to assist the Tax Commission.

Before describing methods followed in arriving at the valuation of a mine, a better understanding of the problem will be obtained if we discuss briefly the elements which make up the value of a mining property.

The first of these is the ore.

The second is the shaft and other openings by which access to the ore is gained.

The third is the machinery and equipment necessary to mine the ore and take it to the surface, such as drills, mine cars, haulage locomotives, hoists, etc.

The fourth element comprises the repair shops, warehouses, and other buildings which are necessary for the conduct of the operation and housing of employees.

The fifth element is the stock or ore piles at the surface ready for shipment. As practically all the iron ore shipped from Wisconsin goes by boat down the Great Lakes, this fact necessitates

the accumulation of the ore in great piles at the surface during the winter months when navigation is closed.

In addition to the foregoing major items of property there are miscellaneous things such as teams and wagons, mine timber, etc.

If the custom followed with farm property or manufacturing property were followed, each of these items would have to be valued by itself.

This would make a very difficult job, particularly with relation to the large item of value, the ore in the ground. As the valuation of ore in the ground by itself is an exceedingly difficult and practically impossible matter, valuing engineers both for taxation purposes and for the occasional necessity of valuation for sale, consolidation, or joint operation have used a simpler and more accurate method.

This method is exactly the same in principle as insurance companies use in computing the price of an annuity. If a man desires to purchase an income of \$1,000.00 a year for ten years, he has to pay down a sum which together with the interest upon it will enable the insurance company to pay him the income desired. For the first \$1,000.00 to be paid at the end of the first year he pays a sum which at the given rate of interest will amount to \$1,000.00 at the end of *one* year. For the \$1,000.00 to be paid him at the end of the second year, he pays the sum which together with the interest on that sum for *two* years will equal \$1,000.00. For the \$1,000.00 to be paid at the end of the third year, he pays a sum which together with interest upon it for *three* years will amount to \$1,000.00. The sum of all these "present values" is the amount which he must pay the insurance company for the \$1,000.00 annuity.

If we were to reverse this process and value a business which will return to this man a net income of \$1,000.00 a year, we could do it in exactly the same way. This is the method which is applied by valuing engineers the world over to the valuation of mines. It does not result in a value of the mine proper, but it results in a valuation of the *total future business* of the company. While the method differs from that used in valuing a farm or business property, it results in practically the same valuation. If a certain farm after paying for the labor of producing the crops will return a perpetual net income of \$6.00 per acre, at ordinary rates of interest this farm would be worth \$100.00 per acre.

The chief difficulty in connection with the valuation of a mine comes in estimating the total amount of ore that is to be produced in that property. In none of the iron mines in Wisconsin can this be known with any great degree of accuracy. A mine sinks its shaft deeper and puts in a new level and develops the ore, so that they know the size of the ore bodies on that level. The ore that they have already developed on the levels above gives a very good

idea of the total amount of ore above this bottom level and can be estimated very closely. This ore, the extent of which is fairly completely proven, is called developed or proven ore. The difficulty comes in arriving at a fair idea of how far below the bottom level the ore body may extend. It may go five feet or it may go several hundred feet. When the State of Michigan started to value its mines in this fashion, a large number of hearings were held and it was finally agreed upon by the valuing engineers and the mining companies that to assume a downward extension of 100 feet below bottom levels was an assumption that was fair and reasonable both to the taxing bodies and to the mining companies. When this work was started in Wisconsin, this matter was discussed at considerable length by the members of the Tax Commission and the Geological Survey and the mining companies and it was decided to adopt this same extension of 100 feet below bottom levels *excepting in cases where drill holes or other information may prove definitely that the ore body extends either deeper or less deep than this 100 feet.*

In determining the valuation of a mine for the Wisconsin Tax Commission, the Geological Survey employs practically the same method as does Michigan. This method involves first the estimating the *total tonnage* to be mined, second estimating the *future yearly production*, and third from the records of the company finding the *average profit per ton* made in the seven years preceding the time of valuation. This profit per ton multiplied by the tons per year gives the total yearly profits to be expected from the mine. This yearly profit is treated as an annuity, each annual profit is discounted at the rate of six per cent to its present value at the time of valuation. The sum of these present values of future annual profits is taken as the *total value of the business of the company.*

In reaching the figures for tonnage of ore, allowance is made for the bunches of rock that are always found within the limits of the ore bodies. This allowance is that established by the past history in each mine, but is usually ten per cent. In estimating the future annual production due consideration is given to the facts—whether this will increase or decrease or remain stationary.

In estimating the profit per ton the figure desired is not only the profit to the operating company, but the total profit yielded by the property. The profit from the mine is usually divided among three groups. First is the operating company which makes a profit (or loss as the case may be). Next is the owner of the land who leases it to the operating company and receives as rent a certain royalty on each ton of ore shipped. Third is the banker who loans money to operate the property, and so can be considered to have a temporary interest in the property. His share of the profits is received as interest on his loan.

To illustrate the way in which the total profit is derived, the following three cases are shown:

	I	II	III
Operator's profit per ton-----	\$ .75	\$ .20 loss	\$ .70 loss
Royalty per ton-----	.30	.30	.30
Interest per ton-----	.05	.05	.05
Total profit per ton-----	<u>\$1.10</u>	<u>\$ .15</u>	<u>\$ .35 loss</u>

The profit figure used in valuing the mine for taxation is that which a man would get if he bought out both the operator and the owner of the land and used his own money instead of borrowing at the bank.

In the elements before described as making up the value of a mine all but the fifth have a value only so long as there remains ore in the ground to be mined. Obviously the shaft will have no value when the ore is all mined. In a district where there is no other industry the mine buildings, and the employees' homes will be valueless when the ore is mined out as there will be no occupation for the miners and they will be forced to seek work in other regions. The mine machinery will have only a scrap value when the ore is gone as most of it is designed to fit the needs of this particular mine.

So, if we consider our hypothetical buyer, all these items would have to be included by him in his purchase price, for if he paid more than the profit warranted—all these items have been contributing during the past seven years to the profit used as a base figure—he would not get his money back.

Consequently the present value of the future profits includes the value of the buildings and all other personal property used to operate the mine as well as the value of the ore in the ground.

In addition to this value the operator has an ore stock pile all mined and ready to ship on the assessment date—May 1. He has expended money and labor in mining this ore, and hoisting it, and piling it at the surface. The value of this stockpile is, of course, not the value that will be ultimately realized. It is valued as a merchant's stock would be valued—at what he could sell it for as a unit, not at what he will receive when he retails it. The merchant's stock must be carried on his shelves at risk of fire or other damage for months before it can be sold, and there is a very considerable selling expense. So no purchaser of the stock would pay the retail price. Similarly, an ore stockpile may have to be carried for several years before the owner is fortunate enough to sell it. This is particularly true of a pile of ore that is of poor grade. Furthermore the expense of loading and shipping, the selling expense and the profit a new purchaser would properly expect to make must be deducted from the ultimate selling price.

On the other hand an operator may have his ore all sold by May 1st so that he knows definitely what he will receive.

All these facts are taken into consideration when valuing the stockpile.

Therefore the figures furnished by the Geological Survey to the Tax Commission are

1. A value of the "*ore in the ground*" which includes the value of all the real and personal property necessary to operate the mine. This includes in addition to ore in the ground the value of the shaft and openings, the machinery and equipment, the shops, warehouses and other buildings necessary for operating the mine and housing the employees, and the horses, wagons, mine timber, machinery supplies, and other items of personal property excepting the stock pile.

2. A value of the "*ore in stockpile*" which is the value that could be realized by a unit sale to a purchaser on the assessment date.

The law requires personal property and buildings to be valued separately from the land. Since the Geological Survey is not equipped to value buildings and personal property, aside from stockpiles, this has been left to the Tax Commission and the local assessors. In order to comply with the law the local assessor should value the personal property other than stockpile. This value should be subtracted from that given for "*ore in the ground*" and added to the "*value of ore in stockpile*" to get the *total personalty value*.

The remainder, after this subtraction, is the combined value of buildings and land. The local assessor should value the buildings and subtract them from this combined value entering the remainder as "*land value*" and his assessed value of buildings as "*improvements*."

This may be shown as follows:

1. "Value of ore in ground" as given by the Geological Survey .....	\$1,000,000.00
2. Local assessors' value of personal property other than stockpile .....	85,000.00
3. Total value of "land and buildings" .....	<u>\$915,000.00</u>
4. Add—	
Assessor's value of personal property .....	\$85,000.00
"Value of stockpile" (given by Geological Survey) .....	<u>280,000.00</u>
5. Total value of personal property .....	<u>\$365,000.00</u>
6. Subtract from above—	
Value of land and buildings .....	\$915,000.00
The value of buildings as determined by the local assessor .....	<u>115,000.00</u>
7. Value of "land" or true value of ore in the ground ....	\$800,000.00

These items are 100% of true value. If the other property in the taxing unit is assessed at only 90% or some other fraction of true

value, the same percentage of these values should be used. The assessor will then have the figures to enter in his book to comply with the law.

1. Value of personal property .....	\$365,000.00
2. Value of buildings, .....	115,000.00
3. Value of land .....	800,000.00
<hr/>	
4. Total value of mine.....	\$1,280,000.00

## THE INHERITANCE TAX

The proceeds from the inheritance tax are always uncertain in some degree, due, not only to the greater or less number of estates disposed of during the year by the several county courts, but also to the amount of property transferred in these estates. The very large estates are relatively few in number, and there may be several such estates settled in one year, and few or none in the next. In the largest estate settled during the last fiscal year the tax was computed and assessed at \$286,228.27. However, more than half of this amount was paid into the county treasury as an advance payment during the preceding year. Hence the tax in this estate affected the total inheritance taxes for the last two years. This illustrates the possibilities of variance in the total inheritance tax collected year by year.

As a matter of public interest the total inheritance tax paid into the state treasury year by year since the enactment of the law is given as follows:

June 30, 1904 (three months) .....	\$14,319.77
June 30, 1905 .....	125,964.80
June 30, 1906 .....	103,954.74
June 30, 1907 .....	396,458.39
June 30, 1908 .....	245,653.32
June 30, 1909 .....	449,000.93
June 30, 1910 .....	283,566.97
June 30, 1911 .....	848,033.78
June 30, 1912 .....	783,528.90
June 30, 1913 .....	924,700.66
June 30, 1914 .....	458,903.21
June 30, 1915 .....	570,170.73
June 30, 1916 .....	502,937.98
June 30, 1917 .....	860,779.30
June 30, 1918 .....	517,389.97
June 30, 1919 .....	778,022.00
June 30, 1920 .....	1,115,643.85

Total .....	\$8,979,029.30
-------------	----------------

In 1917 the rates were raised so as to increase the income from the tax to the probable extent of 25 to 33 per cent (Ch. 320, Laws of 1917, in effect June 2, 1917). The increased rates apply only to estates where death occurred after the passage and publication of the statute. Consequently, the effect of the increase could not be fully apparent in the returns to the state treasurer until about eighteen months after the enactment of the law. The effect of the increase for a full year is not apparent until the report for the fiscal year ending June 30, 1920.

It has been suggested that in view of the great increase in the public expenses during the last few years, the inheritance tax rates might be again increased. It may not be amiss in this place to offer a few suggestions proper for consideration in that connection.

Only three states now have no inheritance tax; Alabama, Florida and South Carolina. To these may be added Alaska and the District of Columbia. Hence the probability of removal from state to state to evade the tax on the part of wealthy residents has its limitations. But there are still five other states that have no direct inheritance tax, but only a tax upon transfers to collateral heirs and strangers.

The rates vary in the different states, no two states being entirely alike in this respect. The present rates in this state rank among the highest. The only state having a distinctly high rate is California. About one-third of the states may be fairly classed with Wisconsin; and about two-thirds of the states may be classified together as having rates that are materially lower.

The federal estate tax, enacted in its present form chiefly as a war measure, exceeds the state inheritance taxes by about three times in the larger estates. The smaller estates, those of \$50,000 and less of clear value, are exempt from the federal tax. The National Tax Association strongly advocates the repeal of the federal estate tax, leaving this source of revenue entirely to the states; but its repeal in the near future is not probable. While the state and national governments are taking about 12 to 15 per cent of the larger estates, it may be doubtful whether further increase of our state rates is advisable, especially in view of the fact that this state is one of those having the highest state rates. If the federal estate tax should be repealed in the near future, it is probable that some advance in our rates might well be made; and it is likely that some increase will be made in other states. In the meantime it is a question well worth considering whether it is wise to advance our rates much beyond those prevailing in other states.

## CHAPTER IX

---

### UNIFORM MUNICIPAL ACCOUNTING

As early as 1901 the necessity became apparent for constructive legislation looking toward the development of a sound system of uniform accounting in Wisconsin municipalities. Methods of accounting then in use not only lacked uniformity but were entirely inadequate to give intelligent information as to the disposition of revenue raised through the general property tax, the principal source of income for municipalities. The tax commission recognized the fundamental relationship between the interests of revenue raising and revenue expenditure and in its 1903 report directed the attention of the legislature to this phase of municipal taxation. As a result, in the act creating a permanent tax commission, a general provision was inserted conferring upon the tax commission the authority to devise a uniform system of accounts for municipalities. No specific provision was made for making actual installations and the result was that little, if anything, was done upon the basis of the authority conferred by Chapter 380, Laws of 1905.

The necessity for definite action in regard to uniformity in municipal accounts was felt when in 1909 the legislature by joint resolution requested the tax commission to conduct a statistical investigation into state and municipal finances. An investigation of state finances was completed and a report was submitted to the 1911 legislature. No report was made covering the investigation of municipal finances for the reason that municipal accounts were not kept in such a manner as to permit of dependable or comparable results. On this account it was considered expedient to defer statistical work along this line until a proper foundation based upon uniformity in municipal accounting methods could be established. It was with this in view that the tax commission recommended and the legislature enacted Chapter 523, Laws of 1911. The statute supplemented Chapter 380, Laws of 1905, and enumerated specifically the duties of the commission in regard to the collecting of statistics and the formulation of a uniform system of municipal accounts. It is under this statute that the municipal accounting department of the tax commission was established and is now operating. Under the provisions of this section, it makes it the duty of the tax commission:

- (1) To inquire into the system of accounting of public funds in use in towns, villages, cities and counties.
- (2) To devise, prescribe and at the request of any town, village, city or county, to install a system of accounts which shall be as nearly uniform as practicable; provided, that when so installed the system shall be retained by the town, village, city or county.
- (3) To audit the books of the town, village, city or county officers upon the request of the town or village board, city council, or county board, or upon its own motion.

Upon the basis of the authority conferred under the statute quoted above, a uniform system of accounts was designed and accountants were employed to make installations and audits.

In an effort to secure complete uniformity in municipal accounting some states have made the adoption of their systems by municipalities compulsory. This was not done in Wisconsin. In the first place, local officials in some instances resent the intrusion of the state into municipal affairs and it was felt that if the municipalities were allowed to adopt the prescribed system voluntarily they would cooperate fully to make its operation a success. In the second place, with over seven-teen hundred municipalities in the state, a very large organization would have to be developed in a short space of time in order to handle the work. Under the plan of voluntary adoption the department could be built up gradually and additional accountants could be trained as the demand for the service increased. Subsequent experience has established the soundness of this policy.

Since the inception of the organization in 1911, there has been a constant and steadily increasing demand for the services of this department with the result that up to 1920, 125 audits had been made and 170 municipalities had contracted for the installation of the uniform system. Of the 71 counties in Wisconsin, 41 are now operating under the uniform system of accounts and of the 135 cities, 53 use the state system. The chart at the end of this chapter shows the installations in graphic form.

In the majority of cases a combination of factors has resulted in a request on the part of a municipality for audit or installation service from this department. Some of the more evident motives are here mentioned.

(1) The rapid growth of municipalities together with the broadening out of their governmental activities has intensified the necessity for modern methods of accounting.

(2) Inability on the part of accounting officers to properly make out the financial report of receipts and disbursements required by the tax commission has directed attention to the defects of the old fund system. This one factor alone has been responsible for a desire on the part of many municipalities for improved accounting.

(3) Suspicion or actual knowledge of misappropriation on the part of accounting officers frequently results in application to this commission for auditing and accounting service.

(4) It is not infrequent for one administration to request an examination of the preceding administration for purely political reasons.

(5) The recognized inadequacy of "committee audits" and the statutory requirements (in case of commission governed cities) are also contributing factors.

So far as municipal auditing is concerned, three classes of examinations have developed. The purpose of each class in the order of its relative importance follows:

- (1) To ascertain the true financial status of the municipality.
- (2) To detect fraud and establish shortages if any exist.
- (3) To analyze expenditures and set up items of illegality.

Audits to ascertain the true financial condition of municipalities are usually made annually and in most instances where the municipality has adopted and is operating the uniform system of accounts, this type of audit is of most value to the municipality and it is gratifying to note by the increasing number of applications for this class of service that municipalities recognize this fact. Annual audits are now being made by this commission in twenty cities and counties.

Next in importance comes the specific examination the chief object of which is to detect fraud and to establish shortages if any exist. It has been our experience in most cases where discrepancies on the part of accounting officers have been found that governing bodies responsible for administration have not been entirely free from blame. In the first place, in many cities and counties officials in positions of trust are not held to a proper accounting with the result that serious discrepancies in their accounts may remain unnoticed. This recognized negligence on the part of city councils or county boards serves to encourage dishonest officials to acts of misconduct whereas complete accountability would preclude the possibility of defalcation remaining undetected. Then too, in many cases the salaries allowed officials by governing bodies do not represent an amount sufficient to meet living costs. While this fact cannot excuse the conversion of public funds to personal uses it does furnish in many instances the initial incentive.

Of the forty audits completed by this department during 1919 and 1920, eight resulted in the disclosure of shortages involving in the neighborhood of \$15,000. The beneficial effect of shortage disclosures of this kind extends beyond the conviction of the official and the recovery of the amount misappropriated. It directs the attention of the municipality involved to the lack of system in the handling of its finances as well as to its own negligence in not demanding proper accounting on the part of officials. An experience of this kind usually results in an application for the installation of the uniform system and a request for annual auditing service. This is not confined to the municipality involved but has a wholesome effect upon surrounding districts wherever the situation is known.

The third type of audit is that made for the purpose of setting up illegal and questionable expenditures of public funds. The irregulari-

ties brought to light during examinations of this kind result from ignorance of the law rather than from willful misconduct. In this connection it may be stated that certain classes of expenditures, clearly illegal under existing statutes, are worthy of legislative sanction. The allowance of traveling expenses to municipal officials on public business would come within this class.

The constant and increasing demand for service since the inception of the work more than justifies the entrance of the tax commission into this field. It is now well established that the many problems peculiar to municipal accounting preclude the possibility of success except under authorized central direction. In the first place without supervision there would be no degree of uniformity. Then too, municipal officials are constantly changing and some agency must be available from which the new officials can receive assistance relative to accounting questions.

The sole purpose of the tax commission in this work is to provide competent auditing and accounting service for municipalities at actual cost to the state. It is believed that many advantages may accrue to the municipalities of the state through making use of the department. The accountants employed by this commission have become specialists in this work and are thoroughly conversant with the laws governing municipal procedure. Few private or commercial accountants in the state have handled sufficient municipal work to have become as thoroughly qualified in this work as have the representatives of the municipal accounting department. The fund of financial information readily available to our accountants together with the unbiased character of their work gives added value to the accounting service rendered by the tax commission. An effective follow-up policy, so necessary in municipal installations, is a feature of the work possible only through the central direction of a state agency.

The work of this department has progressed to the point where it is safe to predict that uniform municipal accounting through voluntary adoption will become universal in Wisconsin.

## CHAPTER X

---

### FINANCIAL STATISTICS OF WISCONSIN CITIES

---

The discussion is based upon the following outline:

PURPOSES OF THE WORK.

PLAN OF THE REPORT.

THINGS TO BE REMEMBERED IN MAKING COM-  
PARISONS OF COSTS IN DIFFERENT CITIES.

EXPLANATION OF TERMINOLOGY.

DISCUSSION OF THE TABLES.

CONCLUSION.

## PURPOSES OF THE WORK

---

### IN GENERAL

To the average reader statistics of any sort are dull and uninteresting, and therefore hard to understand. Largely for this reason, the statement is heard that "there are three kinds of lies—lies, damn lies, and statistics." Nevertheless, the use of statistics in some form or other is necessary to show exact conditions of any given static situation. By their use, also, changes that have occurred in the past are clearly emphasized so that causes for the changes may be found. The nature of any variation taking place at present is brought to light so that it is often possible to predict future happenings with some degree of certainty. Statistics, as Rowley has defined it, is "the science of counting."

It is common knowledge that every year sees an increase in the total revenues and expenditures of all governmental bodies. This constant increase is due, not so much to higher prices which make governmental activities cost more, but to the fact that more governmental activities are constantly being introduced. The needs of the people are being satisfied more and more through governmental agencies. Thus, in addition to long-established city activities such as building streets, maintaining schools and furnishing police and fire protection, we find the modern city providing amusement halls and recreation grounds free of charge, dental clinics, public school nurses and medical attention for school children, furnishing ice, fuel, water and light at cost, and often maintaining public markets where groceries, and in some cases, staple articles can be purchased. Recognition is being given to the fact that the highest community welfare may be achieved through governmental operations.

In view of this constantly increasing governmental activity, data showing what operations have cost in the past and what

they may be expected to cost in the future are invaluable. Because each citizen in a community has only a small financial interest it does not follow that all principles of business economy may be ignored. Facts as to costs and results are necessary for efficient administration. If standards of costs or of results are known it is possible for officials to gauge the effectiveness of current operations by such standards, and for the public to judge the accomplishments of the administration. Efficient popular rule cannot come until citizens are intelligent regarding their common business.

#### SPECIFIC PURPOSES

1. We are all familiar with the plaint of the average taxpayer that "taxes are high." This is because he thinks of government only as an agency which collects taxes. He often wonders why taxes are so high, where the money goes, how the tax rates per capita and per \$1,000 of property valuation compare with those of other adjacent cities. This report endeavors to answer these and similar questions in the tables and charts following.

In some cities it happens that the administration follows the rule of frugality to such a degree that the welfare of the community suffers. Again, the popular desire to "keep the tax rate down," leads to under levies and the city must borrow to finish the year. If this occurs for many years, the city soon finds itself in a state of continuous financial embarrassment as tax collections are used to repay loans. Sooner or later the actual situation must be faced and sufficient taxes levied to make up the deficits of earlier years. Whatever the conditions, they should be generally known.

2. The great value of statistics, as stated above, is in making comparisons. When the cost of an object or governmental service can be compared with the cost in prior years, or in other cities, knowledge replaces guesswork and administrative officials can proceed accordingly. High costs lead to a study of the reasons for their existence, unexpected savings may be made, certain operations may be changed or discontinued and others enlarged upon. In short, every contemplated act can be viewed in the light of what has taken place in the past.

3. A very real benefit which has resulted from the requirement that all cities submit reports of receipts and disbursements is the disclosure that accounting systems in use in some cities are antiquated and inadequate. It is frequently said that there is a causal connection between good accounting and success in the business world—that the successful business man must know costs, that he must know from what sources his profits come or to what factors he may attribute losses. Likewise, there should be good accounting in all municipalities,—accounting which will tell the facts about the business in hand and also serve as a guide in making plans for the future.

A good accounting system for a city should show :

- a. The revenue that has accrued to the city from each source.
- b. The expenses incurred for each purpose both for operation and maintenance and for outlay.
- c. The financial condition of the city at any given date—what it owns and what it owes.
- d. Data by which city officials may be guided in planning future operations.
- e. Appropriations made by the legislative body and the unexpended balances thereof.

A good accounting system is decidedly not “a necessary evil.”

The accounting department of the tax commission has devised a system of accounts which meets the above requirements. This system is now in use in fifty-three Wisconsin cities and is a demonstrated success. These cities are :

Algoma	Hartford	Plymouth
Altoona	Horicon	Port Washington
Ashland	Hurley	Prairie du Chien
Baraboo	Jefferson	Racine
Beaver Dam	Ladysmith	Reedsburg
Berlin	Madison	Rice Lake
Black River Falls	Manitowoc	Ripon
Boscobel	Marshfield	Seymour
Chilton	Medford	Shawano
Clintonville	Merrill	Stoughton
Columbus	Mineral Point	Sturgeon Bay
Crandon	Neenah	Two Rivers
De Pere	New Richmond	Watertown
Eau Claire	Oconto	Waukesha
Elroy	Oshkosh	Waupun
Fort Atkinson	Park Falls	Wausau
Grand Rapids	Peshigo	Whitewater
Green Bay	Phillips	

4. The fact that city officials are required to submit reports of financial transactions to the tax commission does much to

disclose irregularities in their accounts, as has been shown in many cases. It is believed, also, that when statistics of *results* of operations (such as miles of street paving, street sprinkling, etc.) are submitted with the figures of cost, so that unit rates and percentage ratios can be obtained, that the requirement of such reports will do much to prevent questionable and wasteful practices. If the cost per square yard of concrete paving is a great deal higher in one city than in another, investigation will be made—either by city officials voluntarily or because demanded by the people,—and any existing corrupt practice, or wasteful business methods will be uncovered.

---

## PLAN OF THE REPORT

---

### CLASSIFICATION USED

As stated above, all cities of the state are required to submit reports of their financial transactions on blanks furnished by the Tax Commission. The classification of receipts and disbursements is that used, with few differences, by the United States Bureau of the Census, by Massachusetts, New York, California, and Iowa and is generally accepted by the best authorities on municipal accounting.

The general outline of the classification follows:

<i>Receipts</i>	<i>Disbursements</i>
General Revenue	Operation and Maintenance
Taxes	General Government
Special Assessments	Protection of Person and Property
Licenses and Permits	Health Conservation and Sanitation
Fines	Highways
Gifts, Grants and Other	Charities and Corrections
Commercial Revenue	Education other than Schools
Amounts Borrowed	Recreation
Investment Receipts	Unclassified
Agency and Trust Receipts	Outlays
	Municipal Public Service Enterprises
	Investment
	Amounts Paid on Debt
	Agency and Trust

### RECEIPTS AND DISBURSEMENTS PLAN

The report form sent out by the department is devised to show cash actually received and disbursed during the year. It would be better, of course, to show revenues accrued and expenses incurred, regardless of cash receipts and payments. It would be impossible, however, for many Wisconsin cities to show their financial transactions on a revenue and expenditure basis because of the inadequate accounting systems in use. The receipts and disbursements plan is therefore the only one that can be used, at present, by all cities.

### ARRANGEMENT OF TABLES

The publications of municipal statistics of prior years have shown names of cities arranged according to population. The advantage of this arrangement exists in that cities of practically the same population were placed next each other. Population is the one best basis of comparison,—i. e.—cities of like population normally have similar receipts from the same sources and similar disbursements for like purposes. Thus expenditures, exceptional and extraordinary circumstances excluded, which ought to be similar in amount, were placed next each other and so more easily compared. The disadvantage of the population arrangement is that a person interested in one particular city has to search for the name or for the key to the arrangement in preceding pages.

Believing that the disadvantages of the population system outweigh the advantages, the alphabetical arrangement has been followed in this pamphlet. It is thus easy to find any one city. To the left of the name of each city is given the population as determined by the United States Census of 1920, and so comparison between cities of like population is possible. This method makes the tables and the information they contain more readily available to the man who does not wish to study them at length.

## THINGS TO BE REMEMBERED IN MAKING COMPARISONS OF COST IN DIFFERENT CITIES

---

### 1. Basis of Comparison

Data for only one basis of comparison—that of population—is given in the tables. Among other factors which may influence comparison are:

- a. area (affecting cost of street lighting, street paving, water-mains, etc.)
- b. natural resources (building stone, water supply, etc.)
- c. location (water-front cities have occasion for kinds of disbursements not found in the south central part of the state.)

### 2. Differences in accounting classifications

Many cities are using record-systems not based on scientific accounting principles. The classifications in use differ radically from that of the schedule sent to clerks to be filled out. Accordingly, in order to fit the city's business to the classification of the tax commission, it is necessary to reclassify all or most of the receipt and disbursement items. At best, the result is not as accurate as if the final classification had been made at the time the transaction occurred.

Many clerks consider the work of reclassifying receipts and disbursements as an unwarranted added burden. However, if statistics of value are to be obtained, it is necessary that there be uniformity in the form of reports submitted, and all cities should make the same kind of report. Previous to the entry of the tax commission into this field there was practically no similarity between accounting systems and classifications used in any two cities. The commission adopted a form which employs a classification approved by the best municipal accounting authorities. Fifty-three cities are now operating accounting systems based on this classification. Others have signified their intention of adopting it in the near future.

**3. Changes in the personnel of city clerks**

Fifteen new clerks took office in 1919, and 32 in 1920. New clerks require some time to learn the duties of their offices, ordinarily do not do their work as well at first, nor make their reports as accurately or the distribution of receipts and payments as intelligently.

**4. Differences in civic organization and methods**

Most Wisconsin cities are governed by a city council, but some have adopted the commission form as shown in Table 53. Some cities pay contractors with special assessment certificates; others collect the certificates and pay contractors in cash. Some cities pay for the cost of paving one-third of the street and charge abutting property owners one-third each. Others divide the total cost (except for street intersections) between the property owners, making each side pay half.

**5. Differences in fiscal years**

As stated in the preface, twenty-four cities do not end their fiscal year on December 31. Those whose years end on or about March 31 are Amery, Augusta, Appleton, Barron, Brodhead, Buffalo, Cumberland, Fennimore, Menasha, Menomonie, Oconomowoc, Oconto Falls, River Falls, Sheboygan, Shullsburg. Cedarburg closes its year March 15. Beloit, Janesville, and Rice Lake close on April 15. On April 30, Greenwood, Kenosha, Neillsville end their years. September 30 is the closing date of Ashland and Superior, and November 30 of Reedsburg.

Several cities in the above list have signified their intention of making out their reports in the future so as to include the twelve months ending December 31. For the present, however, it is plain that receipts and disbursements for a city whose year ends September 30, as in the case of Ashland and Superior, are not strictly comparable with those of a city for the period ending December 31.

**6. Differences in results accomplished**

Consideration should be given to differences in results accomplished by expenditures for the same purpose in different cities or for different years in same city. A larger expenditure may mean more or better work done and of course t

reverse may be true. To serve the purpose best, statistics of results should accompany those of cost. It is one of the aims of this department to supply data as to results of operations with which the statistics of costs may be compared.

---

## EXPLANATION OF TERMINOLOGY

---

### RECEIPTS

General revenue receipts come from compulsory contributions levied by a city in the exercise of its powers of taxation and police, there being no direct relation between the amount of the contribution and the benefit derived. Taxes, licenses, and permits, fines, grants and gifts are the principal kinds of general revenue receipts.

Commercial revenue receipts are those which come from regular business transactions to which the city is a party. The rental of articles owned by the city and interest received on city money are examples of commercial revenue receipts.

The column "Amounts borrowed" includes both temporary loans and bond issues.

"Investments" mean the receipt in cash of money previously invested by the city.

Agency and trust receipts are those in which the city acts merely as an agent, as for example, in the collection and payment of state, county and school taxes.

### DISBURSEMENTS

Operation and maintenance disbursements are for the regular running expenses of the city proper without the schools. Table 56 divides the operation and maintenance total according to purposes for each city.

Payments for protection of person and property are for police and fire departments, sealer of weights and measures, and other like purposes.

Health conservation and sanitation payments are for board

of health, sanitation and fumigation expenses, city nurse, garbage collection and disposal, etc.

Amounts shown in the highway column include payments for maintenance of streets, sidewalks, curbs and gutters, for the cleaning, sprinkling, and lighting of streets, for weed cutting, snow removal, etc. •

Charities and Corrections is self-explanatory.

Payments for Libraries is self-explanatory.

Recreation payments are for parks, playgrounds, Memorial Day, homecoming, and other like expenses.

Outlays are disbursements for objects which have a permanent or semi-permanent value, i. e., whose benefits last longer than through the year in which they were incurred. Examples are payments for new street paving or for a new city hall or fire truck.

The remaining terms used need no explanation.

## DISCUSSION OF THE TABLES

It is not proposed to discuss the contents of each table separately. Those interested in a particular city are probably in a better position to know the reasons for abnormal conditions existing there which are reflected in the tables than any person not intimately acquainted with the life in the city. Comment will be given largely to explain the material given and where necessary, the form of the tables, and to point out conditions which might not be evident to the casual reader.

### POPULATION

In 1880 about one-fourth of the people of Wisconsin lived in cities. In 1920, more than half was city residents. This transition is shown at ten year intervals in the following summary.

<i>Census</i>	<i>Population of State</i>	<i>Population of all cities</i>	<i>Per cent of City Residents</i>
1880.....	1,315,497	329,011	25.01
1890.....	1,686,880	647,713	38.39
1900.....	2,069,042	875,868	42.33
1910.....	2,333,860	1,080,751	46.30
1920.....	2,631,839	1,322,909	50.27

The figures in the last column to the right are shown in chart A.

# CHART. A

## PERCENTAGE OF WISCONSIN PEOPLE LIVING IN CITIES 1880-1920

Percentage increases in state and in city population over those of each previous census are as follows:

	% Increase State	% Increase All Cities	Difference in % Increase of City over State
1880.....	24.73	.....	.....
1890.....	28.23	96.86	68.66
1900.....	22.65	35.22	12.57
1910.....	12.79	23.39	10.60
1920.....	12.76	22.41	9.65

The last column shows that city growth was faster than state growth in all periods but that the amount of the excess of percentage of city growth over percentage of state growth is growing less, i. e., that the city population is not increasing as rapidly in recent years as at the beginning of the period.

## BONDED INDEBTEDNESS

Table I shows the limit of bonded indebtedness of each city, the actual bond debt on December 31, 1919, and the per capita bond debt. The debt limit, as prescribed in the state constitution is five per cent of the assessed valuation of the city in the last (1919) assessment. It will be seen that Madison has the highest per capita bonded debt.

## TAXES AND TAX RATES

General Property Taxes, the per capita tax, and the tax rate per dollar of assessed valuation, are given in Table 48. In order that comparisons may be on a correct basis, the assessed valuation of each city is given and the ratio of this figure to the true value as found by the tax commission.

Table 49 shows the kinds of general property taxes i. e., analyzes the total figure given in Table 48, into taxes for state, for county, for schools, and for strictly city purposes. Chart B, shows the same thing, using an average of the figures for all cities. Taxes raised in conformity with the soldiers' bonus law (Chap. 667, Laws of 1919) inflate the state taxes for 1919, and make column 2 of Table 49, non-comparable with other years. The figures in column 2 are, however, strictly comparable as shown, for comparisons between cities for 1919.

The kinds and amounts of school taxes are again shown in Table 50. The tax rate for school and school district taxes is given in the last column to the right. This figure is not the same as the local clerk's school rate because we have included the county school tax (see heading "School and School District Taxes") whereas the county school tax is levied on the *city*, not on the school district.

Table 51 shows the tax rate per school child enrolled which obtains in all cities having city superintendents. The figures for enrollment are taken from reports filed with the State Department of Public Instruction. In those cities where there are joint school districts the enrollment of the city portion of the school district was obtained by applying to the total enrollment of the school district, the ratio of the city school census to the total district school census. (The "school census" includes all

children of the district between the ages of 4 and 20, whether in school or not, while the "enrollment" means children enrolled in schools of the district, whether or not they are residents.)

## CHART B

### GENERAL PROPERTY TAXES IN CITIES 1919.

The amount of normal income tax levied in each city, the cash collections, personal property and coupon offset, and the delinquent amounts, are shown in Table 52. The soldiers' cash bonus and educational surtaxes paid in cash in each city are given in one sum in the last column to the right.

## SALARIES OF CITY OFFICERS

Table 53 shows the annual salary for each officer of every city at the rate existing June 30, 1920. Salaries of assistants are not given. Peculiar conditions existing in any city as where one man holds two positions are explained as far as possible by foot-notes.

## RECEIPTS AND DISBURSEMENTS

Table 54 shows for each city total receipts divided into General Revenue, Commercial Revenue, Amounts Borrowed, and.

## CHART C

SHOWING DISBURSEMENTS FOR OPERATION AND MAINTENANCE CLASSIFIED BY PURPOSES.

Agency and Trust. (For the meanings of terms used, see paragraph "Discussion of Terminology.") General Revenue is shown divided into Taxes, Licenses and Permits, and Other.

A summary of disbursements is given for each city in Table 55. In each case the amount spent for operation and maintenance, for outlay, for the repayment of debt, and for schools, is shown. Agency and Trust disbursements are omitted as they are not strictly a part of the city's internal government and tend to increase the total unduly.

The operation and maintenance disbursements are analyzed in Table 56, which gives the total spent according to purposes. The same information is shown for all cities in Chart C. Table 57 shows total and per capita disbursements for city running expense (operation and maintenance) and for schools.

---

## CONCLUSION

---

It is not presumed that the figures given in the tables following are accurate in all details. It was impossible to get good reports for some cities because of the poor accounting systems in use, and some errors will occur in all statistical studies of length. However, no effort has been spared to make the compilation as reliable as time would allow.

It is hoped that in future years, dependable figures of *costs and of results* may be given. It is desired to show expenses incurred by purpose or activity, subdivided by department, by character (operation, maintenance or outlay), and by object. Data can then be obtained which will show cost by jobs, by units (as per yard of paving), and by averages. The administrator will then realize the significance of facts which might not otherwise appear and accurate records of all costs needed to guide officials will be available.

Interested citizens and the general public will be able to form a true conception of what a good government should be and to judge their own government's defects and virtues without bias or prejudice. Interest will be stimulated in opportunities for improvement and there will follow a popular desire for good government which no administration can afford to ignore.

In the past, poor government has been due, not so much to dishonesty and corrupt practices, as to ignorance of what to do and how to do it. If this pamphlet brings to city officials an active desire for improved methods of procedure in city government or awakens citizens to the fact that they should be interested in government and that the responsibility for good or bad government rests upon them, it will have served its purpose.
